THE
RELATIVE IMPORTANCE
OF
ANCIENT AND MODERN LANGUAGES
CONSIDERED AS BRANCHES
OF
GENERAL EDUCATION.

NEW YORK :
D. APPLETON AND COMPANY,
346 & 348 BROADWAY.
1856.

in the Clerk's office of the District Court of the United States, for the
Southern District of New York.

11567

"Am I wrong in believing that the tendencies of the age are in favor of decreasing rather than increasing the amount of time bestowed upon classical scholarship?"

"Unless I be so, the necessity of a limitation is apparent."
DR. R. G. LATHAM.

"The interchange of ideas with the contemporaneous world, is of as much importance as the preservation of the ideas of the past; and the tongues which men now speak are those which men should learn to understand."

SIR ROBERT KANE.

NEVER were the means of intellectual communication more needed, than at the present day. Such is the spirit of the age, that the members of different communities fraternize under the influence of similar institutions, similar pursuits, and similar tastes. Nationalities merge into one great family: they are no longer separated by seas and mountains; steam navigation, railroads, and the electric telegraph bring into contact the most distant countries. The cheapness of travelling, the reduction of postage, and the free circulation of the public press, which will soon be extended to all civilized nations, will, not less than the rapidity of conveyance, bring them into closer intimacy with each other, and thus aid in divesting them of national antipathies and prejudices. The old barriers which ignorance, monopoly, and a want of international intercourse had raised between them, are now, in spite of the apparent hostility of political parties and narrow-minded patriots, crumbling in every direction before the irresistible power of a generous and enlightened philanthropy. Well conducted periodicals spread knowledge in the homes of the humblest; and scientific associations call successively into the great seats of industry the intellectual representatives of the civilized world. Isolated labor is every where, and for every purpose, giving

way to the spirit of association: instead of wrapping their discoveries in secrecy, men of all countries diffuse them as means of universal advancement. The competition of human industry which the great capitals of the world have witnessed of late in their colossal exhibitions, marks a new era of international communion; by creating among the nations of the earth a generous emulation in art and practical science, it has imparted a powerful energy to civilization, and cemented the great pact of universal fraternity and mutual good will. War itself, though horrible as ever, has changed its nature under this influence, and together with devastation, now carries civilization in its train. Men, until now bitter foes, are no longer but accidentally so, and wherever they meet on friendly ground, they vie with each other in advancing the great interests which concern mankind. This happy tendency towards close union among nations, is farther shown by the growing taste which they evince for the cultivation of each other's language, and which, together with necessity, has made their study an essential part of modern national education.

In the fifteenth and sixteenth centuries, when Europe had just emerged from barbarism, and the arts and sciences were at their lowest ebb, the modern languages containing nothing worth reading, the people could find the information they required only in the languages of Greece and Rome. These were, indeed, efficient instruments of civilization; they furnished the elements of liberal education, and imparted intellectual life to the modern world. All efforts were consequently directed towards them; and as Europe, with perhaps the exception of Italy, had then but very imperfect dialects, those languages served to record the notions and opinions of the time, and became the vehicles of communication between the learned. Latin, especially, was to them really a living language; but it has, as well as Greek, lost its importance in proportion as modern languages have been perfected and stored with knowledge in every department. The ancient tongues having thus become very limited in their use, and being studied no longer for their own sake, but only as a *means*, it has been asked whether modern languages cannot supply their place entirely, and be studied both as an *end* and as a *means*?—which suggestion, as may be well imagined, has drawn forth bursts of indignation from those trained exclusively in the old scholastic course, and above all, from those who, deficient in both ancient and modern languages, had been accustomed to look upon "classical" knowledge as the badge of "a gentleman."

We may as well at once declare, that we have no sympathy with those who seem to fancy that they have sneered off the whole controversy by the contemptuous phrase, "dead languages," and

whose views may be best expressed in the words of the parson's son, in Crabbe's "Tales of the Hall:"

"What can men worse for mortal brain contrive,
Than thus a hard dead language to revive?
Heavens! if a language once be fairly dead,
Let it be buried, not preserved and read,
The bane of every boy to decent station bred;
If any good these crabbed books contain,
Translate them well, and let them then remain;
To one huge vault convey the useless store,
Then lose the key, and never find it more."

(B. 16.)

Too many need to be reminded that the term *dead*, as applied to language, is not equivalent to lifeless or barren. It is not always true that "a living dog is better than a dead lion;" and the solemn words, "he being dead yet speaketh," are true scarcely more of the great departed, than of the language he spoke or wrote. We even see no small gain in the possession of a language undefiled by the vulgarizing associations, the cant, and slang, and gossip of daily life.

On the other hand, we are constrained to reject as invalid, not a few of the arguments employed in defence of "classical" instruction. We hear too much of the great benefit which the revival of ancient literature rendered to the world in the middle ages,—a benefit which has been transmitted even to our time, and which, it would seem, requires us, if we would not be ungrateful, to maintain the study of the ancient classics as thoroughly and extensively now as then. The argument may not be put precisely in this form; but it really comes to this: else, what avails the declamation about "the classic sun scattering the darkness of ages," and much to a similar effect? We grant that the study of the Greek and the Roman languages and literature ought to be maintained, and that some members of the community ought, for admitted reasons, to attain proficiency therein; but it surely does not follow, by any simple and unquestionable inference, that the whole body of our educated youth ought to devote themselves to that study,—especially if, as is alleged, so many years of severe labor are required for their tolerable mastery,—a period, moreover, through which, from the nature of things, so few can pass, as the large majority of pupils leave school at an early and imperfect stage of "classical" attainment. If this be right, it must be justified on other and quite independent ground. And yet those two things, so widely different, are perpetually confounded. There are, in fact, three questions which it is indispensable to disentangle and to keep distinct:—1st. The obligations of our modern literature to the ancient; 2d. The importance of preserving the ancient languages from neglect and oblivion; 3d. The utility of subjecting all our youth indiscri-

minately to a course of classical discipline. Too often have we occasion to observe that arguments in favor really of the first, and still oftener of the second of these positions, are perverted to the support of the third.

Again, we cannot grant the monopoly of æsthetic culture, so often claimed for the ancient classics. The very word "*classics*" itself is a sort of petrified expression of this fallacy. At the time when the title was bestowed, its appropriateness was beyond a doubt; but since the whole wealth of modern literature has been created, the title has ceased to be exclusively applicable, and ought no longer to be exclusively applied. Of our own English authors we need not speak; but when we have such writers in German as Wieland, and Goethe, Richter and Schiller; in French as Bossuet, Voltaire, Molière, and Corneille; in Italian as Dante, Tasso, Ariosto, and Machiavelli:—the term "*classics*" ought never to be applied even to the immortal productions of Greek or Roman fame, without the word "*ancient*" prefixed, by way of a saving clause in favor of *modern* classics, which also well deserve the name. On this subject one of the staunchest advocates of "*classical*" training very justly remarks: "The raptures which some people seem to feel in perusing Homer and Virgil, Livy and Tacitus, while they turn over the pages of Shakspeare and Milton, Hume and Robertson, with coldness and indifference, I hold to be either pure affectation, or gross self-delusion; being fully satisfied that we are in no want of models in our own English tongue, which, for depth of thought, soundness of reasoning, for truth of narrative, and what has been called the philosophy of history, nay even for poetical beauty, tenderness, and sublimity, may fairly challenge comparison with the most renowned productions of antiquity."¹

We are well aware that nothing very new can remain to be said upon a topic so often debated; yet as it is one of ever increasing importance, we venture to lay before our readers the following few pages, in which we have collected in condensed form the views of those who have meditated most on the subject, and which, from their being scattered through many volumes and various languages, may well have escaped the attention of even those most interested in the cause of education. Not that in these matters we should blindly follow every thing foreign; nor should we always reject it merely on account of its being so. What Mr. Cousin affirms of the true greatness of a people, essentially applies to education:—"It does not consist in borrowing nothing from others, but in borrowing from all whatever is good, and in improving whatever it appropriates."² In

¹ J. PILLANS. *The Rationale of School Discipline*. Lect. iii.

² V. COUSIN. *Leçons de Philosophie à l'École Normale*.

another place this great philosopher says, "The science of education is an essential branch of moral and political philosophy, and, like all other departments of science worthy of that name, it has need of being surrounded by the light of experience; and to avoid the danger of being misled by fantastic theories, we must lose no opportunity of obtaining an accurate acquaintance with the various systems of education that are followed by all great civilized nations."¹

Unfortunately, this branch of social science has not yet received with us that share of attention to which its importance renders it entitled: the consequence is, that, while our arts have made immense progress, and our manufactures have undergone admirable improvements, the art of instructing men is still subject to the baneful influence of tradition and routine. Educational questions, like questions of law, are yet apt to be decided by precedent; and often a subject continues to be studied, rather because antiquity has sanctioned the practice, than because its value is clearly seen. But this slavish idolatry of the past ossifies the human mind, and keeps it in hopeless bondage. The world is now older than it was in the days of our ancestors: they were our juniors; they had only their own experience, we have theirs in addition to ours; our minds are fed in our childhood with the fruit of their maturity; we start in our career with many advantages of which they were deprived: we, consequently, ought to know more, and be more capable of discerning right from wrong. It is, then, contrary to reason to sacrifice our views to theirs, and to make their opinions the standard of our conduct.

The objects of instruction being now greatly multiplied, it must be obvious to all, that the time formerly devoted to "classical" learning must be proportionally shortened, to make room for the study of branches of knowledge indispensable in our advanced state of civilization. Availing ourselves of the favorable position in which we are placed by the present state of educational science, we will, therefore, before entering upon our subject, commence our inquiry by briefly recapitulating the general principles of this branch of social science, introducing a general summary of the acquirements which a complete education should comprise, in order to attach to each study its relative importance, and thereby determine the branches of learning and the departments of language most required at the present day.

¹ V. COUSIN. *De l'Education en Hollande.*

EDUCATION, the first want of society, proposes to confer on man the highest improvement of which his *body*, his *mind*, and his *soul* are capable, with a view to secure his well-being, to fit him for society, and to prepare him for a better world. Hence, general education is divided into three branches—*Physical*, *Intellectual*, and *Moral*. The first aims at health, strength, and beauty; the second, at mental power and the acquisition of knowledge; and the third, at piety, justice, goodness, and wisdom.

To effect the gradual perfectibility of man's physical, moral, and intellectual constitution, and to secure the various acquirements which constitute his highest improvement, God has given him—in addition to the instinctive impulses which he possesses in common with other animals—physical, moral, and intellectual faculties, or innate powers of action, susceptible of being improved, and which it is his duty, as well as his interest, to cultivate within rational limits. Consistently with his original freedom, he has been endowed with the privilege of exerting over his faculties a voluntary control, by which he can modify, regulate, and perfect them; thus, he becomes the subject of culture and discipline. Different from the animal tribes, which reach the perfection of their being, not by gradual development, but at once, and without the aid of education, he is a progressive creature; his powers are unfolded, and his acquisitions made only through a process of slow and careful training. He has to learn every thing, while they instinctively possess all the knowledge which they want. Education is the law of his nature, as uncontrollable and limited instinct is that of the brute.

All the acquirements which contribute towards human perfection, arise from a proper cultivation of the faculties. Exercise is the source of that cultivation; it is the vital principle of education. Exercise affects the original powers of man's constitution in two ways; it imparts to them energy in proportion to its quantity, and generates peculiar qualities, aptitudes, or capacities, consistently with its particular nature. But in the application of this great principle, excess and exclusiveness must be avoided. An excessive or exclusive exercise of any faculty would be as prejudicial as its utter neglect. It is the preponderating activity of some one faculty to the exclusion of others, or the over-indulgence in one particular mode of its actions, which produces those inconsistencies of character,

those aberrations of mind, often observed in men. Although the innate powers are few in number, the qualities, aptitudes, and capacities to which their varied exercise, and their different degrees of native activity give rise, are so numerous, so diversified, and so opposite in their kind, that man may be the noblest, or the most contemptible being of the creation, according as they are properly, or improperly directed and exercised. Hence, although his organization is universal and invariable, his physical, moral, and intellectual character, which depends on the qualities acquired, varies with *time, place, and the progress of civilization.*

The faculties have all their legitimate spheres of usefulness, and the benefits to be derived from each depend on their harmonious development. They are, in fact, different instruments, all of which are indispensable for attaining man's possible perfection; and, as such, they require to be duly improved, and properly applied, to secure the ends for which he was placed on this earth. Although connected by secret ties, the faculties are yet so independent of each other, that each demands special and distinct exercises for its due cultivation. It is the noble office of education to direct their natural activity, to extend and multiply their various energies, as also to indicate the means by which they may best perform their work, and by which they are most subservient to happiness.

In order to advance towards the threefold perfection, physical, moral, and intellectual, education should take under her guidance the faculties of man, as they gradually dawn, with a view to aid their spontaneous action, and improve them by proper cultivation. At the moment of birth they are in complete torpor. The physical faculties are the first which manifest themselves, because they are indispensable to our existence; next appear the moral faculties, to direct the organs of sensation, and to secure the well-being of the individual. The intellectual powers are usually the last to be in full activity. Thus nature indicates the order to be followed in the successive cultivation of these different classes of faculties, until the general manifestation of them all permits their simultaneous training. The principle of slow progression runs through all that is created to grow and improve. Gradation is an invariable law of nature; and it is in conformity to that law that the great art of education consists.

Youth is the season of life assigned by Providence for giving a proper direction to the faculties, for training the habits, and laying the foundation of the physical, moral, and mental character. Still, education does not end here: it continues throughout our earthly existence. The discipline to which man is subjected while young, ought to be considered only as a preparation for the great

education of life; its primary object is to enable him to improve himself afterwards, and to adapt himself to the particular circumstances in which it shall please Providence to place him.

The threefold process which transforms the most helpless being into the noblest work of God, is too vast in its details to permit us to do justice to the subject in these few pages, which are not offered as a treatise on education, but merely intended to exhibit the fundamental principles of the Science of Education, on which should be based the study of languages, the main object here under consideration. They should be constantly kept in view, as no system of instruction can be safe or successful, which has not its foundation in a knowledge of the constitution of man, and which is not formed with due regard to the end proposed in education.

PHYSICAL EDUCATION has for its objects the preservation of health, the cultivation of the physical faculties, and the acquisition of useful arts and accomplishments.

Physical perfection may be said to consist in bodily strength and beauty, which are the offspring of a healthy constitution and of well-developed organs. The child generally comes into the world in a healthy condition; it is the duty of the educator, whether the parent or his substitute, to preserve him so. Hygiene prescribes for this object rules, which are but too often neglected. It would be impossible to state the extent of injury done to humanity by the almost universal ignorance of this important branch of the medical science. The benefits of health are not confined to the individual; they extend to the community and to the future generation. And not only does health affect physical education, it has a direct influence on moral and intellectual training. Health, in fact, is the foundation of the whole edifice of education. The mind is incapable of exerting all its energies and the heart its kindest affections, if the body is in a state of debility or disease.

The connection between the body and the mind, and their reciprocal dependence on each other, as established by physiology and psychology, should never be lost sight of. An educator must understand the animal economy of man, in order to study with advantage his higher faculties. Whatever he attempts to teach, from the first elements of knowledge to the higher truths of science, his success will depend in a great measure on his acquaintance with the functions of the human frame, and on the extent to which he acts in obedience to the laws of physiology. The mental and the moral powers with which the child is endowed, manifest themselves through the medium of organization, and no plan which he can devise will be successful for their cultivation, that is not in harmony with the laws which regulate that organization.

As the healthy development of the individual, as far as it can be effected by a close attention to diet, sleep, cleanliness, air and clothing, devolves more particularly on the parent, we may leave this matter further unnoticed here, and limit ourselves to a few brief remarks on the cultivation of the physical powers and the acquisition of useful arts and accomplishments.

So irresistible is the natural impulse which prompts to action the muscles and limbs, that, in health, a positive pleasure arises from their activity, although it may be accompanied with fatigue and even danger: their inactivity is, on the contrary, a cause of much uneasiness. A judicious training of these organs would tend considerably to improve the human frame. Grace of deportment, elegance of manners, ease of motion, strength, activity, dexterity, and all that is attractive and pleasing in the physical nature of man, depend, in a great measure, on well-directed muscular exercise.

Gymnastic exercises afford the most effective means of cultivating and improving the muscular system and the locomotive organs. These exercises, and all sports which demand physical activity, call the muscles and bones into action, strengthen the limbs, and impart a healthy tone to the organs: under their influence the blood circulates freely, the respiration is quickened, the digestion becomes active, the nervous system is invigorated, and the redundant fluids are driven off by perspiration. More attention should be paid to this branch of hygiene, as it is important to a state to possess an active and vigorous population. It was amongst the Greeks and the Romans, the basis of national education. The great attention which they paid to it contributed not a little to the success of their arms. The Greeks, especially, were as a nation physically and intellectually a superior race of men; and there is every reason to believe that their unrivalled attention to physical education was highly influential in producing this result.

Gymnastics embrace all the accomplishments of which the organs of voluntary motion are the instruments, and which may be resorted to as relaxation from mental labor. Still they should not be indiscriminately pursued; and, although they are generally beneficial, yet as they have each their special sphere of physical improvement, perseverance in any of them should be regulated by the particular circumstances of the individual. In making a selection, therefore, the preference should be given to those which favor most the cultivation of attention, demand most dexterity, are most consistent with future pursuits, and present the greatest chance of utility in after life.

Young persons should be induced to attend to manual occupations and useful arts, which might alternate with mental pursuits; such occupations and arts would not only be to them a never-failing

source of amusement, but would give them early in life a command of their hands, and would usefully exercise their organs of sense. The excellence at which mere children often arrive in mechanical operations and in some of the fine arts, as may have been seen at a late exhibition of the New York Board of Education, sufficiently proves the early natural capabilities of the physical powers, and the law of nature, in regard to the order of physical and intellectual education.

The activity of the physical faculties being always, in their development, in advance of that of the mind, manual occupations not only may be indulged in before intellectual exercises can be seriously commenced, but serve as the best preparation for them; because most mechanical pursuits demand the co-operation of the mental powers. They particularly exercise attention and perception; they incite a spirit of observation and invention; they habituate the mind to the formation of plans, and the observance of proportion; they bring out, in fact, every intellectual resource.

The practice of any art, even the simplest, is the application of some of the principles of science: familiarizing young people with facts illustrative of these, will, at a future period, render their study of science more interesting and profitable, as presenting to them innumerable opportunities of applying to practical utility the one in which they may be thus engaged. Mechanical ingenuity has in many instances given rise to intellectual pursuits of the first order. Many discoveries in the arts, have led to the discovery of unknown laws in nature, and of new principles in science; for, in the progress of knowledge, theory generally follows practice. Had Mongolfier not been a practical as well as a scientific man, the hydraulic ram might for ever have remained as speculative and useless a philosophical project as it was in the hands of Hales.

If children are accustomed to the use of tools, and are gradually taught to work in paper, pasteboard, wood, and metals, as their physical progress permits the difficulty to be increased, they will soon acquire a mechanical skill which may, at a future time, prove very beneficial to themselves and to others. Manual dexterity makes us, in a great measure, independent of others, and gives us the means of providing for our own comforts in most of the circumstances of life. It is indispensable in many professions, but particularly to the votaries of natural philosophy. Those who have distinguished themselves in high conceptions in the sciences, and by useful inventions in the arts, have, for the most part, early in life displayed a taste for mechanical operations, and have constructed with their own hands the instruments or apparatus necessary for illustrating their discoveries. Archimedes fabricated his own wonder-

ful machines; Galileo made his own telescopes; Torricelli his barometers; Michael Angelo, Leonardo da Vinci, Roger Bacon, Benjamin Franklin, Kepler, Herschel, Pascal, Newton, Watt, Fulton, Brindley, Humphrey Davy, Cuvier, Morse, Babbage, Lord Rosse, and many others, were aided by their mechanical skill in gaining celebrity, fortune, and the enviable glory of being the benefactors of mankind.

Locke and J. J. Rousseau have recommended mechanical pursuits—the first as a substitute for “the useless and dangerous pastime of fashion,” the second as a provision against adversity. We go farther, and advocate such pursuits as necessary accompaniments to, and powerful means of intellectual education, and as the great instruments of civilization. Labor and industry are for nations the safest means of prosperity, as they are for individuals the purest sources of property and independence. Hence the industrial element should enter more largely than it usually does in primary education. Indeed, no system of education is complete which does not provide, by due attention to useful arts, for the activity of the physical powers, for relaxation from mental labor, and against reverses of fortune. There is no station in society, be it ever so high, which may dispense with them altogether. Many instances might be recorded in which powerful princes have derived benefit from skill in manual occupations. By a law of Solon, the children whose parents had neglected to have them instructed in some profitable trade, were relieved from the obligation of maintaining them in their old age.

But however important physical training may be, it should be kept within judicious bounds, as an excessive activity of the physical faculties is usually acquired at the expense of higher faculties. It is a well-known fact, that mental excellence is rarely the portion of those who devote much care and time in increasing the volume of their body and the force of their muscles. We ought to seek in muscular action only a means of health and diversion, without aiming at a superiority which is not consistent with the occupation of a highly cultivated mind. “Men,” observes Londe, “who give themselves up exclusively to muscular exertions, are deficient in sensitiveness, moral tact, reflection, and intellectual labor.”¹ “It would be difficult,” says also Richerand, “to find in history the example of a man who has combined with the physical powers, which the muscular temperament implies, distinguished strength of the intellectual faculties. For excellency in the fine arts and in the sciences, there is need of exquisite sensibility, a condition absolutely at variance with much development of the muscular masses.”² Tissot’s aphorism will be

¹ *Gymnastique Médicale.*

² *Nouveaux Eléments de Physiologie.*

found true, in general, that "the man who thinks the most digests the worst, and *vice versa*, he who thinks the least digests the best." ¹

✦ MORAL EDUCATION has for its object the cultivation and direction of the moral faculties, so as to enable us, through their means, first, to acquire the virtues and fulfil the duties required by our condition as creatures of God, and social beings; and secondly, to imbibe the sentiments and inclinations which can insure individual happiness.

The moral faculties which education proposes to cultivate and direct, in order to unfold the qualities which constitute moral acquirements, and to advance towards moral perfection, are, *Self-love*, *Sympathy*, *Curiosity*, *Conscience*, and *Will*.

These moral faculties, like the physical faculties, are inherent in our nature; they exist in every individual, independently of exercise or reflection; but their activity is greater or less, according to their original degree of energy, which varies in different individuals, and according, also, as they have, or have not been cultivated: whereas the moral acquirements, that is, the consciousness of duties, the virtues, affections, and inclinations which proceed from these faculties, and which constitute the elements of *piety*, *justice*, *goodness* and *wisdom*, exist in man only as a consequence of the predominating energy of certain faculties, or inasmuch as they have been inculcated by suitable example and exercise. Apprenticeship is as essential for acquiring benevolence, disinterestedness, prudence, and patience, as it is for attaining skill in any gymnastic feat or handicraft trade. The law of exercise is universal in its application. Moral precepts may be brought to the aid of practice; but, to be effective, they must be the generalization of good and virtuous acts which have previously come under the notice of the child; otherwise they have no meaning. A precept of morality is an abstraction; and it is not by abstractions, by definitions, or by general principles, that virtue can be deeply inculcated in the hearts of children. Good habits, fostered by example, are the foundation of a truly moral education.

By dint of doing what is right, we at length find it difficult to do what is wrong. "Make sobriety a habit," says Lord Brougham, "and intemperance will be hateful and hard: make prudence a habit, and reckless profligacy will be as contrary to the nature of the child grown an adult, as the most atrocious crimes are to any of us. Give a child the habit of sacredly regarding the truth, of carefully respecting the property of others, of scrupulously abstaining from all acts of improvidence which can involve him in distress, and he will

¹ *De la Santé des Gens de Lettres.*

just as little think of lying, or cheating, or stealing, as of rushing into an element in which he cannot breathe."

Still, practice has its limits: a blind and excessive indulgence of *Self-love* would produce egotism; of *Sympathy*, weakness; of *Curiosity*, indiscretion; of *Conscience*, irresolution; and of *Will*, obstinacy. Excess in the moral acquirements would be equally injurious. Benevolence may instigate to generosity, at the expense of justice; a father may carry firmness to tyranny, and a mother the love of her child to blamable indulgence; blind patriotism may engender aversion for other nations. Whether we aim at the cultivation of faculties, or at the acquisition of moral qualities, excess and exclusiveness must be carefully avoided.

It is the sacred duty, as it is the noblest privilege, of parents to secure for their children, and to disseminate through society, the benefits of moral education. But, among the numerous portion of the population whose life is consumed in incessant labors, and to whose industry, fatigue, and privations the nation is indebted for its wealth and power, parents are often deprived of sufficient leisure to watch over their offspring, or are destitute of the moral character indispensable for guiding them in the path of duty and virtue; well informed educators should therefore supply their deficiency. A portion of the revenues of the state could not be better employed than in moralizing and improving those who contribute so largely to them. Secular education ought to be under the superintendence of government, and enforced upon the people by legislative enactment.

There are still persons who object to this interference with parental authority and private speculation, as an infringement upon the liberties of the people; but they forget three things—first, that the child belongs to the state as well as to the family; secondly, that the great majority of parents are much in need of direction for the proper training of their children; thirdly, that the unavoidable influence for good or evil of the teachers over youth, makes it imperative on the part of society to examine their qualifications, and superintend the discharge of their office, in order to secure the community from the dreadful consequences of ignorance, imbecility, or immorality on their part.

It may be inconsistent with liberty to force a special *instruction* upon the people, because the kind of instruction best for individuals being a matter of opinion, it is neither just nor proper to impose any in particular; but *moral education*, exclusive of religious distinctions, does not differ in kind with the social position and the future avocation of children. Morality is one and the same for all, and is imperative upon all; the tranquillity, the prosperity, the very existence of society depend upon it. We do not see how its being

made obligatory, or how the right, on the part of the state, to institute, superintend, and inspect educational establishments, could interfere with the liberty of the people, any more than the obligation to pay taxes, refrain from dishonesty, or submit to the intrusion and inquisitiveness of custom-house officers. The compulsory moralization of the depraved is far more justifiable and more consistent with liberty, than the compulsory detention of mendicants, or the prohibition of the sale of intoxicating liquors.

That legislative interference with national education is consistent with the respect due to parental authority and to private industry, is so manifest, that the principle is carried out with general satisfaction, and almost without opposition in this country, where the rights of individuals and the liberty of conscience are more largely recognized than any where else. Plato and Aristotle, Washington and Jefferson, all staunch republicans, are among its warmest advocates.

The legislature of a free and civilized country is not only entitled, but is bound to provide the most efficient means of preventing immorality from entailing degradation and barbarism on the nation. A government which does not give moral education to the people, has no right to expect from them order and support; nor can the law, consistently with justice, punish faults which have been committed in the absence of the moral consciousness which it is the object of good education to impart. In fact, the nearer to perfection and the more general education is, the less will the laws need to punish.

The venerable Von Tück, the present Head of the Orphan House in Potsdam, acting under the influence of this truth, has set to the world an illustrious example of self-denial and Christian charity. A nobleman by birth, and for fourteen years a judge in one of the courts of Prussia, he had, during his practice in this high office, to try so many criminal cases arising solely from the early neglect of the education of the culprits, that he at last felt reluctant to pronounce sentence of condemnation upon them; and, impressed with the sublime truth that the teacher who saves his fellow-citizens from committing crimes, does more good than the magistrate who waits for their perpetration to inflict punishment, he resigned his office, with all its honors and emoluments, to become an educator.

It is especially among that numerous portion of the people, the laborers and operatives, that moral principles should be early imbibed and virtuous habits formed. The interest of society and their own happiness require, above all, that they should be impressed with the conviction that, if knowledge opens the road to success, virtue is infinitely superior to knowledge, and that *piety, justice, goodness, and wisdom*, are the greatest blessings of education, and the acquirements most worthy of their ambition.

INTELLECTUAL EDUCATION consists in two distinct objects—the cultivation of the intellectual faculties properly defined as *Education*, and the consequent acquiring of knowledge, called *Instruction*.

Hence we see that instruction is only one of the subdivisions of education. The latter has for its object the perfecting of the whole man, considered physically, morally, and intellectually; instruction proposes solely to store his mind with information. Education is a *generic*, instruction a *specific* term. These words, *education* and *instruction*, *educator* and *instructor*, must not be confounded one with the other.

The intellectual, like the physical and moral faculties, should be cultivated by exercises calculated to produce their greatest development, and tending to secure intellectual acquirements. It is on the external world, and through the medium of his senses, that the child can most profitably exercise his opening intellect. His sensations and curiosity constantly call his intellectual powers into play, while conscience and will direct their action. On the other hand, physical and moral life require, to be guided by the light of intellect. Thus are the operations of the mind intimately connected with those of the body and of the soul. The different orders of faculties assist each other through the whole course of education; but, although the physical and moral development during infancy and childhood subserves intellectual education, this education is in full activity only from the tenth or twelfth year. It is, therefore, from that age only that exclusively mental studies should be commenced.

The universal admission that success in life and personal consideration, depend on intellectual development and extensive knowledge, have led many, in their ignorance of physiological principles, to force mental labor on young children. But in most cases, both the minds and bodies of the little sufferers have been enfeebled by an over-exertion of the brain, when as yet imperfectly formed. There is nothing more painful to witness than the unnatural disproportion which mental precocity introduces between physical and intellectual life. Parents and teachers have much to answer for, who, regardless of the manifest designs of nature, condemn young children to sedentary occupations, and force intellectual acquirements upon their tender minds, at the risk of unduly exciting the nervous system, injuring the brain, and undermining the constitution. So close is the immediate connection between mind and body, that the former cannot be over-exerted without the latter feeling the baneful effects of the undue excitement.

The most eminent physicians of ancient and modern times proclaim the fatal influence which overstraining the mind of youth has on the health and bodily frame. Of the numerous medical authori-

ties which we could bring forward on this point, we will confine ourselves to one, that of the celebrated Tissot, who says:—"Long continued application in childhood destroys life. I have seen young children of great mental activity, who manifested a passion for learning far above their age, and I foresaw with grief the fate which awaited them; they commenced their career as prodigies, and ended by becoming idiots, or persons of very weak minds. No custom is more improper or cruel than that of some parents, who require of their children much intellectual labor and great progress in their study. It is the tomb of their talent and their health."¹ Of those who have survived the direful effects of a premature and exclusive excitement of the mind, few indeed have ever risen to eminence.

The histories of the nations among which classical literature and the sciences have been much cultivated, and which have consequently afforded parents opportunities or inducements to force abstract studies upon their children, abound in facts which prove the truth of these observations. Intellectual precocity is but too frequently attended by premature death or debility through life. The instances are very rare of young geniuses having arrived at old age; whilst, on the contrary, many of those whose education began comparatively late, have remained engaged to the end of a long life in the most intensely intellectual labor.

"Experience," says Dr. Spurzheim, "demonstrates, that of any number of children of equal intellectual power, those who receive no particular care in childhood, and who do not learn to read and write until the constitution begins to be consolidated, but who enjoy the benefit of a good physical education, very soon surpass, in their studies, those who commence earlier and read numerous books when very young. The mind ought never to be cultivated at the expense of the body; and physical education ought to precede that of the intellect, and then simultaneously with it, without cultivating one faculty to the neglect of others; for health is the base, and instruction the ornament of education."²

The mental faculties which education proposes to cultivate are: *Attention, Perception, Conception, Memory, Imagination and Judgment*. These faculties have for their common object the acquisition of knowledge, or instruction, constituting intellectual acquirements; each performs a particular office in the complicated mental process by which that acquisition is made. The possession in the various qualities of which they are susceptible would constitute an active and

¹ *De la Santé des Gens de Lettres.*

² *View of the Elementary Principles of Education.*

well-regulated mind; the greatest advantage which intellectual education can bestow.

The intellectual faculties exist originally in all men; but they, no less than the physical and moral, vary in every individual in quality and degree of activity, each giving rise to a variety in consciousness, aptitude, and capacity. Some persons are endowed with greater powers of perception, and others of conception. In some, memory predominates; in others, imagination; and in others, judgment; in many, sensation prevails over reason. One individual receives clearer ideas from sensations of sight, another from those of hearing, and so forth, as the eye, the ear, or the other organs are naturally more active or correct. Some memories retain facts better; others, places; others words; others, tunes, &c., according to the peculiar energy of the perceptive powers which take cognizance of these different classes of objects. Imagination is in one person more inventive, in another more imitative; some are prone to deductive, others to inductive reasoning. These differences among men are again indefinitely multiplied by the reciprocal influence which the different orders of faculties have over each other. The predominance of certain moral faculties modifies the course of ideas, as the predominance of certain intellectual faculties modifies the affections and inclinations. Hence, the diversity of taste, or genius, as it is called, which is early manifested for different pursuits. The infinite variety of nature, in physical complexion and outward form, is but the symbol of that which marks the spirit within.

Every intellectual pursuit in early life ought to have for its principal object to invigorate the faculties, and to produce, by means of appropriate exercises, the highest degree of activity of which the mind is capable. All persons have not equal need of the different branches of instruction taught in schools, and they may differ in opinion as to their degree of utility; but all will agree that habits of reflection, investigation, and reasoning, are useful to every individual, and at every period in life. The literary and scientific information collected in youth is not unfrequently laid aside in maturity to make room for the practical business of active life, with which it has often no connection; but high mental capacity is never lost, and is always productive of real benefit.

A method of instruction which would exclusively rest on the action of a single faculty, whatever might be its apparent success, would be most prejudicial to the intellect. Even imagination, which is often checked in young people, ought to have its due share of exercise: it performs an active part in learning and applying language. All the fine arts, among which may be placed the art of expressing thought, owe their best productions to the richness and vigor of that faculty.

However, if any be entitled to more exercise than others, these are *attention* and *judgment*—attention above all, that manifestor of the will, that eye of the mind, without which the other faculties would remain dormant. The powerful influence which attention and judgment have in all the affairs of life, demand that they should act a prominent part in the process of education. They are the guides which direct us in the use of the other faculties and render their action efficient.

Memory, although holding also an important place relatively to the acquisition of knowledge, demands less specific exercise than the other intellectual powers, because the use of it is necessarily involved in their action. Besides, it has abundant employment during the first periods of youth, in storing up the facts impressed through the senses upon the mind, and retaining the corresponding native words. As it predominates in childhood, we are apt to resort to it as a general instrument of instruction; but its exclusive cultivation only tends to make learned fools.

This faculty, it is true, early manifests itself, but it never exists alone: the others begin their action much sooner than persons generally imagine. Children are capable of attention and reflection; they have imagination and judgment; they observe, they invent, they reason, as actively as adults, with this difference, that their sphere of mental activity is confined to matters of comparatively little importance. Their intellectual constitution differs from ours only in degree. If we wish to exercise and improve it, we must offer to their consideration objects suited to the weakness of their minds, and the use and purport of which they can understand, and which may be congenial to their tastes and feelings.

The second part of intellectual education—the acquisition of knowledge—embraces all nature. There exists nothing, from the imperceptible atom to the most sublime object in creation—from the simplest phenomena of our existence to the impenetrable mysteries in which the Divinity is veiled—that man does not desire to know, or does not make an object of serious study.

Such are the wise provisions of the Maker of all things, that not only are the external world and its relations to our constitution so arranged as to hold forth to us every inducement to cultivate our faculties, but the very acquiring of knowledge is the most efficient means by which those faculties can be cultivated and improved. Instruction is the natural nourishment of the mind, and it is as necessary for its growth as food is for that of the body.

Intellectual acquirements had been for a long time the sole object of education, when all at a sudden the cultivation of the faculties was, on account of its great importance in childhood, exclusively

recommended by some educationist. Those, however, who have meditated most on the subject, think the right course to lie between these extremes, and that the two departments of intellectual training should always be combined.

The acquisition of knowledge and the development of the mental faculties lend to each other reciprocal assistance; for, if the mental activity which is employed in the study of any branch of instruction invigorates the faculties, a high intellectual development must, on the other hand, considerably facilitate the acquisition of knowledge. It is by devoting an equal attention to these two points that the end of intellectual education will be gained, and that we shall secure to our children inexhaustible sources of enjoyment, means of success in their respective professions, the power of being useful to others, and an honorable place in society.

In order to facilitate the acquisition of knowledge, it has been classified according to the faculties on which its different branches more particularly depend.

The branches of information which chiefly call for the exercise of memory, consist in the simple record of the things and facts which attention and perception bring under the cognizance of the mind. The study of them is only an act of the memory which collects truths; hence they may be classed under the name of *Histories*.

Those which depend on reasoning, are acquired by starting from known things and facts with a view to arrive, by a series of inductive or deductive arguments at such as are unknown: the object of any train of reasoning is the elucidation of known truths, or the discovery of those which are unknown. When the truths which we investigate are universal, immutable, and linked in a chain of ratiocination, they constitute what is called a *Science*. It is the purport of science to lay down general principles.

The application of the truths retained by memory or discovered by reasoning, to the practical uses of life, whether for gratification or well being, constitutes a third series of information, which takes the name of *Art*. An art is therefore the practical realization of thought—the application of general principles to particular facts. This name is also given to a collection of fixed and general rules, which serve to guide us in that application.

This third class of acquirements demands the action of the physical organs for their execution, whilst the principles on which they rest are within the sphere of the intellectual powers. The knowledge of these principles is of great assistance to carry the arts to their highest degree of perfection. He who practises an art without the knowledge of the principles on which it is founded, will never be any thing but

a simple mechanic; he cannot pass the narrow limits of routine, or surmount difficulties as they present themselves.

The arts which imagination creates by imitation and analogy contribute to the luxury and enjoyment of intellectual life; they exalt the mind by extending its sphere of action above common nature: such is the object of the *fine arts*.

The arts are said to be *liberal* when the action of the moral and mental faculties predominates in their execution, and *mechanical* when they chiefly depend on the physical faculties, or when the habit of execution in them dispenses with the action of the reasoning power.

Memory, reasoning, and imagination are then respectively exercised on three classes of knowledge, *History*, *Sciences* and *the Arts*; for, although all the mental powers take a share in the study of every branch of knowledge, yet each of these three faculties predominates in the class which we have assigned to it.

History, Science, and Art again are classified each into their departments, according as they relate to *nature*, to *man*, or to *language*. These three departments embrace all the information which may become an object of human consideration.

The various branches of knowledge included in the above classification are very numerous, and have latterly been so multiplied that it is impossible for a single individual to embrace them all; some sciences have even been carried so far that it almost requires the exclusive exertion of a long life to reach their utmost extent. The period of education being, moreover, for the great majority of young persons, restricted within narrow limits, it becomes indispensable, in a rational system of public instruction, to confine the objects of study to such branches of knowledge as best discipline the intellect and at the same time are of practical utility through life. The information most required by individuals varies indefinitely with their diversified pursuits in social life; but that which offers the best prospect of being useful in all situations, and which should have the precedence over the others is, we think, an acquaintance with the laws of nature. True knowledge is, in fact, nothing but the interpretation of nature. In nature may be found all the elements of our ideas, all the principles of our senses, all the models of our arts, and endless sources of moral and religious sentiments.

The physical sciences, which have for their object the investigation of the natural laws, are suitable to the different periods of youth, and are useful to all classes of people; they exercise the perceptive powers, enrich the memory with facts and words, excite and gratify imagination to the highest degree, prompt to investigation, and inspire a taste for learning. Although they are not, perhaps, the

best calculated for making profound reasoners, they do not materialize instruction, as affirmed by some persons; they on the contrary cultivate effectively the moral and the intellectual faculties. No literary composition engages the moral feelings and religious sense more vividly than the grandeur and perfection of the material world; none exercises the judgment more usefully than the application of analysis and induction to the phenomena of nature.

The lower animals, under the influence of instinct, blindly follow the course which unerring wisdom has marked out for them; man alone has the discretionary power of conforming to the laws of nature or transgressing them, according as he is, or is not acquainted with them: in resisting them, he abuses his intelligence and liberty, and these valuable gifts become fatal to him; in obeying them, he, on the contrary, is enabled to avoid almost all the ills of life. A knowledge of nature is, therefore, indispensable in order to enable him to act consistently with his destination.

The intimate relations which exist between external nature and the human constitution, render the latter an indispensable subject of study in connection with the former. Man should know his own organization, physical, moral, and intellectual, to be able to understand what are his duties to God, to society, and himself, because he is framed in perfect adaptation to these duties. This comprehensive study of man which, under the name of philosophy, embraces his relations with the universe, and all investigations respecting primary and final causes, would make us better acquainted with the Author of nature, with His laws, His commands, and all the great moral and intellectual truths. Should it not lead to this knowledge, it would be unworthy of our meditation, and ought not to enter into the circle of academic studies.

If we now consider knowledge as an instrument for unfolding the powers of the mind, it must be admitted that, although no particular department of study possesses the privilege of exercising them all, some are more than others conducive to this object. In this respect, literary and philosophical studies seem to claim preference, as the fittest for effecting an harmonious development of the intellectual energies most required in active life.

Mathematics, far from being, as commonly believed, the best logical discipline, would, if studied *exclusively*, rather tend to disqualify the mind for general reasoning. They confine the student to a narrower circle of mental exercises than languages and philosophy: they habituate him to a routine of demonstration which presents little variety; they awaken his judgment to a relation of quantity, neglecting quality and all other important relations. They do not call forth the intellectual powers most useful under all circumstances,

such as observation, comparison, generalization, classification, induction, analogy, which may all be brought into activity, and invigorated by the study of languages and philosophy.

In every step in mathematical demonstrations, there is a constant perspicuity, a straight and limited path marked out, from which it is almost impossible to wander. But, in attending to philosophical, ethical, or literary investigations, the learner has to feel his way, reflect, compare, judge, apply his own experience, weigh probabilities, disentangle net-works of inconsistencies, and lay bare sophistical plausibilities. In this necessity for a diversified and complicated action of the reasoning powers consists the chief value of literary and philosophical studies.

The precision of mathematical expression affords no example of those fallacies which so frequently arise from the ambiguities of ordinary language; nor does mathematical demonstration allow room for sophistry of thought, or for the consideration of improbabilities; because its matter always enforces the correctness of its form, and the certainty of its conclusions; the exact sciences do not consequently provide means of detecting and avoiding logical errors. Hence it is that mathematicians are not unfrequently led to one or other of two opposite extremes—*credulity* or *scepticism*.

These observations are corroborated by the testimony of the most competent judges—Locke, Condillac, d'Alembert, Descartes, Pascal, Destutt-Tracy, Warburton, Goethe, Franklin, Gibbon, Dugald Stewart, and many others, whose opinions have been recorded by a late writer in an able dissertation on the subject.¹

Those who have been exclusively engaged in the exact sciences, accustomed to follow a train of deductive reasoning, and to draw conclusions from fixed principles and from data passively received, are liable to err from limited observation and disregard of undemonstrated truth; they require mathematical proofs in every thing, and are apt to reject moral or probable evidence, although propriety of conduct and justness of opinion, in most of the affairs of life, chiefly rest on such evidence. "Nothing," says Madame de Staël, "is less applicable to the business of life than a mathematical argument."² But, in the study of languages, the understanding is engaged as in the world; we find in both the same dealing with words and ideas, the same caution and discrimination between rules and exceptions, the same mixed relations and contending principles, the same exercises of conception, imitation, and invention: finally, the same methods of induction, analogy, and analysis.

¹ *Edinburgh Review*, No. CXXVI.

² *De l'Allemagne*, t. i., ch. 18.

But, when we thus assign a greater value to literary studies than to those of mathematics, it must be well observed that this is only considering them exclusively as instruments of mental training; for no one can deny the usefulness of the exact sciences as elements of professional instruction, or dispute the expediency of leaving them as co-ordinate to find their level among the other branches of a liberal education. Not only are they the groundwork of mechanics, astronomy, optics, navigation, surveying, and other sciences, but, although restricted in their mode of argumentation, they tend to complete the cultivation of the reasoning powers, by the synthetical and exact process through which conclusions are deduced from their principles. They add to man's power as a thinker, and, hence, as a speaker and a writer. Besides, the more diversified the ideas which the mind acquires, and concerning which it reasons, the more expanded will be its capabilities. "No education," says Dr. Whewell, can be considered as liberal which does not cultivate both the faculty of reason and the faculty of language, one of which is cultivated by the study of mathematics, and the other by the study of the classics. To allow the student to omit one of these is to leave him half educated."¹

Must, then, every one indiscriminately be instructed in all the above branches and in so many others which form now part of a liberal education, is a question which here naturally presents itself. Leaving aside utopian views, which have never yet been realized, and taking the world as it is, we are obliged to answer in the negative; for although all physical, moral, and intellectual qualities which constitute the perfection of human nature are desirable in every individual, whatever be his position in life, it must nevertheless be granted that certain offices, professions and pursuits require for their successful fulfilment the predominance of particular qualities and special branches of knowledge. Now if we take a survey of the different classes of persons claiming education from the State, we shall find that there are three classes whose positions in society and vocations in life, are so distinct that they cannot possibly reach perfection by the same kind of training. There are, in the first place, those who are destined with material means to work on matter—laborers and artisans. Then there is a large class of men whose destiny it is to work on the same external world, but by intellectual means; thus a mason works on stone and lime with his hands, an architect with his mind. Lastly, there is a class of persons in society whose high privilege it is to work by mind upon mind—to this class statesmen, clergymen, teachers of youth, literary and scientific men

¹ *The Principles of English University Education.*

of all kinds belong. This classification, however, it must be well observed, is not in all countries equally distinct: in some it is *systematic*, in others *accidental*, arising from political principles so totally different, that a system of national education which is the height of perfection for one, may be utterly unfit for another. In Russia, for instance, where the population is divided into several castes, distinctly separated, and intended to be so, each class is educated by itself, and instructed in such branches as are most likely to make them realize their expectations in life, without allowing them to pass the limit by which their place has been marked out on the scale of social categories. This system may perfectly suit the existing state of things in a country where rank and distinction are the fundamental principles of the social body, but it can never find its application amongst us, where no recognized superiority exists but that of virtue, knowledge, abilities, and industry. The same reasons will always prevent our following the course adopted in most German States, where education is given in separate schools (Volksschulen, Mittel or Bürgerschulen, and Gymnasia or Gelehrte Schulen) to correspond to the three classes of society referred to above.¹ Much less can we take model on England where no system of education exists, save that of buying instruction, like other commodities, for money, or receiving it from charity.²

Wherever education is controlled by the State we will find it organized on the same plan as society itself; and if schools are, as we think they ought to be, an introduction to the world, they should, in every particular, be framed on the same principle, to be at all a preparation for practical life. Thus in a country where no social distinction is intended, but only accidentally exists, there is not only no need of separate education, but even it seems contrary to Free Institutions not to have all educated in common. Not that the same kind of knowledge is the most suited to all conditions in life, nor does common education imply that all should be confined to that kind of learning which is appropriate to clergymen, to qualify them for ploughmen, mechanics, engineers, merchants, lawyers or physicians; it only requires its course to be so regulated that, while leading directly to the highest branches of learning, their

¹ Dr. F. E. BENEKE, *Erziehungs und Unterrichts-lehre*.

² "England," says HORACE MANN, "is the only one among the nations of Europe, conspicuous for its civilization and resources, which has not and never has had any system for the education of its people. And it is the country where incomparably beyond any other the greatest and most appalling social contrast exists. There is no country in which so little is effected, compared with the expenditure of means; and what is done only tends to separate the different classes of society more and more widely from each other." (*Report of an Educational Tour*.)

successive acquirement be made in an order which will afford the greatest amount of available knowledge and mental improvement, at whatever period the learner may be called away from school to enter upon the active duties of life. Let us now see in what way this result may be attained.

Youth, as we have said, is the season of life designed by Providence for giving a proper direction to the faculties, for training the habits, and laying the foundation of the physical, moral, and mental character. It may be divided into four periods, through which are distributed the various exercises indispensable to a complete education. These four periods are :

1 ^o	From birth to the age of 6	(<i>Infancy.</i>)
2 ^o	“ 6 to 12 years old	(<i>Childhood.</i>)
3 ^o	“ 12 “ 16 “ “	(<i>Adolescence.</i>)
4 ^o	“ 16 “ 20 “ “	(<i>Puberty.</i>) ¹

Reflection and judgment are not, in the first period, sufficiently developed to take an active part in the instruction of the child. It is through the perceptive and imitative faculties that he can, during that period, be given elementary notions of things and of language, these being inseparable. However, at his entrance into life he should not so much be taught lessons, as be formed to those moral and religious habits which are the best preparation for future intellectual education. This preparatory training, or first degree of instruction, is the work of good domestic government, or of infant schools.

In the second period, by means of moderate and progressive exercise of all the intellectual powers, the child must be familiarized with the external world and the phenomena of nature; he must be accustomed to examine every thing, and be made to observe the order, wisdom, and infinite goodness which have presided over all the details of creation: thus he will, by appropriate conversations on these subjects, gain an extensive practical knowledge of the native tongue. Reading, writing, arithmetic, and linear drawing will then claim their share of attention as auxiliaries in intellectual education. A wide range of elementary instruction may thus be attained which will serve as a foundation for future studies. Nature, the consideration of which is the chief object during this period, is, in fact, the source of all progress in every department of knowledge.

¹ It must be well understood that this classification is only approximate; for the natural activity of the faculties is found to vary considerably throughout the different periods of youth. It is not unusual to see, for example, a child of eight years more advanced in physical and mental growth, than one of ten or even twelve.

The objects of instruction which constitute the second degree, must be diversified in such a way that they may bring into action all the rising powers of the child : in fact, his complete intellectual development can be effected only by the variety of objects in which he may be engaged, because different departments of instruction exercise different faculties and qualities of the mind. "General instruction, to whatever degree it is carried, should precede special instruction."¹ The diversity of information which has been early acquired gives correctness to the judgment, and renders every species of knowledge more clear and precise. He who has been exclusively engaged upon one particular class of ideas, however skilful he may be in his command of them, has generally an obtuse mind about other matters. The diversity of objects to which the attention of young people is directed, also, furnishes the means of discovering the pursuits for which they have most inclination or aptitude. This varied instruction ought to be universally diffused throughout all classes of society, because in a civilized community, it is required by all people indiscriminately. It constitutes what is called primary or elementary instruction.

Arrived at this period, the great bulk of mankind are obliged, from circumstances, already to think of the means of earning a livelihood. Learning, it is true, which is elsewhere the privilege of a chosen few, is here the birthright of all; still not all have equal chances of availing themselves of this right. "Pursuit of knowledge under difficulties" is not yet done away with, and to the great majority of young people these difficulties present themselves under such fearful aspects, that they either have not the courage to face them, or give out at the first attempt. Sometimes, also, it is by imitation, or tradition, that they follow their father's trade; most generally it is an opportunity offering itself which necessity compels them to accept. But whatever be the motives which prompt them to believe that it is from their hands they will derive the readiest support, it is now time to commence their apprenticeship, and to direct more exclusively their physical powers towards such arts or manual occupations as may best suit their inclinations, or offer the greatest chances for success, at the same time devoting their leisure hours to intellectual pursuits, that they may also in this way improve,—perhaps one day rise to eminence.²

In the third period, the objects of instruction will be gradually

¹ ST. MARC-GIRARDIN. *De l'Instruction Intermédiaire et de ses Rapports.*

² The institution of a fund providing young people, leaving school under those circumstances, with a copy of "CHANNING'S *Self-Culture*," would perhaps be one of the greatest acts of philanthropy.

raised in character and limited in number, with a view to prepare the pupils for the highest intellectual pursuits and for the respective careers which, according to their talents, offer to each the surest means of being happy and useful. This third degree of instruction should comprise a critical knowledge of the national language and literature, grammar, rhetoric and logic, ancient and modern languages, ancient and modern history, physical, astronomical, and political geography, drawing, natural history, the mathematical and physical sciences, and the theory of morals. Some of these departments of knowledge constituting a literary, and the others a scientific course, should be respectively studied more seriously, according as children are preparing for literary or scientific pursuits; but, as these two objects are ancillary to each other, they should be prosecuted simultaneously, each becoming accessory when the other is considered as principal.

In the fourth period, that of professional education, young persons should complete the instruction already commenced, which bears on their future vocations. It is towards the close of this period that they may direct their attention to the study of legislation, political economy, physiology, moral and mental philosophy, and the science of education, which is useful to all. They should, however, dwell more particularly on the special branches of knowledge which will enable them to fulfil honorably and successfully the duties attached to the liberal professions which they propose to embrace, or to the high offices which may be confided to them by their country or their fellow-citizens.

The subdivision of studies should, in a comprehensive system of national education, correspond to the diversity of social pursuits; for it is not to be expected that individuals can learn every thing. Even those who have leisure and wealth sufficient to pursue the most extensive course of instruction cannot completely master its various branches; and the depth of information attained by individuals in any one department of knowledge is more profitable to them and to the community than superficiality in many. The range of studies, at first unlimited, must therefore be gradually restricted to a narrow compass, and, when once young men have taken their place in society, they must confine their attention chiefly to the subjects immediately connected with their avocations. People can obtain superiority in any pursuit only insomuch as they are exclusively engaged in it. It is a chimera to aim at perfection in several things at the same time.

The information and accomplishments which have been acquired in youth, and which do not bear directly on professional pursuits, should be kept up as a relaxation and as a preventive against

the narrowness of mind which arises from exclusive studies. A mere adept in his art is universally admitted to contribute but little to the intellectuality and enjoyment of social intercourse. It must not be forgotten that, if the subdivision of studies among the different members of the community, like the subdivision of labor in the arts, benefits the mass and serves the worldly interests of the individual, it does so to the prejudice of his general intellectuality. In proportion as the sphere of action of each individual is narrowed, his mental powers become contracted, and his activity is rendered purely habitual and instinctive; he is lowered as a rational being, and resembles the subordinate part of some powerful machinery—useful in its place, out of it insignificant.

In closing this rapid sketch, we cannot forbear regretting that we have been compelled by its limits to confine our observations to generalities of the briefest kind. We hope, however, that the little which we have said may suffice to show what are the instruments and what ought to be the objects of education. These two points were closely connected with our subject, because, on the one hand, an acquaintance with the instruments or faculties, is subservient to the study of languages, and, on the other, we must know what are the objects which enter into a complete course of education, in order to give to each its due share of attention, and, whatever be the importance of languages, to guard against defrauding young people, by exclusive attention to them, of information more useful in after life. It is thus prepared that we approach with confidence the subject of our present inquiry,—the relative importance of Ancient and Modern Languages, considered as branches of Education.

THE history of languages has established this remarkable fact, that, in the course of time, as civilization advances among nations, their original idioms are gradually abandoned for others less inflected, more simple, and more elliptical, which serve as vehicles of communication in ordinary life; whilst these original idioms, as the depositories of national and religious traditions, become classical and sacred symbols for the exclusive use of the learned, and especially the clergy. The mental culture which is promoted by the act of learning to understand these dead languages, and to use them for the expression of thought, tends also to make them the basis of intellectual education. This happens to be the case with the ancient idioms of the Jews, Copts, Chinese, Mongolese, Hindoos, Persians, and other Asiatic nations, as well as with some of the ancient European languages, and more particularly with the Greek and Latin, which have assumed a very extensive field of action in the education of youth.

Ethnography, the classification of nations founded on a corresponding classification of languages, has disclosed the existence of nearly two thousand languages, and five thousand dialects, the greater number of which do not become objects of study, except in rare cases. Of this prodigious number of idioms a few extend over the surface of the globe, and divide, with Latin and Greek, the attention of students. Of these few, ten belong to Europe, namely, the English, French, German, Italian, Spanish, Portuguese, Dutch, Swedish, Danish, and Russian; and nine to Asia, namely, the Hebrew, Syriac, Arabic, Turkish, Armenian, Persian, Chinese, Sanskrit, the ancient language of India, and Hindoostanee, one of its modern dialects.

The mode of acquiring language varies with the peculiar circumstances of the learners, and according as it is a *native* or a *foreign* language. Nature provides abundant means of initiating us into the former; art must supply the method by which the latter is to be attained. In the ordinary circumstances of life the *native tongue* is acquired by practice alone; the *foreign* through the *native*, and by comparison with it.¹

The acquisition of a foreign language through the native, presents many advantages, besides the habits of attention, application, and patient toil, which it forms, in common with other intellectual

¹ The term *foreign*, as employed here, in contradistinction to *native*, applies to any other language, whether it be *ancient* or *modern*.

French

pursuits. We have already adverted to the superiority of this department of instruction over mathematics, considered as a means of mental training; of its beneficial results we will here briefly sum up the most prominent.

1. The *Study* of a second language inures to mental exertion, produces distinctness and accuracy in thinking, and elevates the youthful mind by bringing it into habitual communion with the minds of great writers; it evolves a quick apprehension, an acute discrimination, a patient process of comparison and analogy. It enriches the memory, expands the imagination, invigorates the judgment, and refines the taste in literary matters, by critical analysis of highly finished compositions, the force and beauty of which cannot be adequately conveyed by translation. But it not only cultivates the mental powers by means of the various exercises requisite for the complete attainment of language, it also exercises them in a manner perfectly analogous to their actions in the ordinary course of life.

2. This study enriches the native vocabulary of the learner, and improves his power of composition in the national tongue, by practice in searching for native words and expressions to translate those of the foreign authors; while the peculiar excellences of these authors illustrate the principles which render language clear, forcible, and beautiful.

3. It turns our attention to the formation and connection of ideas, to the nature and mechanism of language; and, by constant comparison of two idioms, teaches general and particular grammar. Thus the acquisition of one foreign language facilitates the learning of others, both from similarity of grammatical principles, and from the habits of study to which the mind is trained by that first acquisition.

4. It tends to engrave on the mind the subjects of which foreign authors treat, by the close attention required in translating them, and by the repetitions necessary to impress their language on the memory. Hence, without losing sight of the main object, it brings under the consideration of the learners many useful branches of instruction, and lessons of morality. It is the groundwork of every species of human knowledge: the study of a science may, to a great extent, be said to consist in learning the true and full import of its nomenclature.

1. The *Knowledge* of foreign languages multiplies the sources of information and intellectual enjoyments, by opening to its possessor new fields of science and literature; and, as it extends oral and written communications between men of different countries, it promotes the advancement of learning and the progress of the arts. If it were generally spread among nations, it would considerably

facilitate their social, commercial, and political intercourse; and would thereby tend to unite them by the strong ties of mutual services and common advantage.

2. It extends our acquaintance with human nature by exhibiting, as elicited in their idioms, the peculiarities of character, customs and civilization of men in different latitudes. It brings under our notice many ideas and sentiments conveyed by expressions for which there are no equivalents in the vernacular tongue.

3. From the affinity which exists between different dialects, an acquaintance with foreign idioms, ancient and modern, opens the rich fields of comparative philology, and leads to the solution of historical questions concerning the origin and filiation of nations, a philosophical investigation in which we have no other guide but the evidence of language.

4. Familiarity with foreign literature tends to destroy national prejudice, by unfolding, as sanctioned by enlightened communities, principles of conduct, morality, and politics, differing from those we have been accustomed to regard as exclusively correct; it guards us from attributing universally to human nature tastes, feelings, opinions, and motives of action which belong only to our age and country; it brings us nearer to truth by the examination, in different lights, of the various departments of knowledge; it enlarges our sympathies as it expands our minds, and does away with that Chinese-like contempt for other nations which is usually entertained by those whose sphere of thought does not extend beyond the narrow limits of their own experience.

All languages are not equally favorable for effecting these various objects. The ancient idioms, for example, being now seldom used as vehicles of intellectual communication, do not present so extensive a field of usefulness as the modern, which are both spoken and written. Among the modern languages, also, many belong to nations whose backwardness in civilization, and poverty in literature, render them but feeble auxiliaries in the acquisition of useful knowledge, the formation of taste, or the discipline of the mental faculties.

Youth, as we have already remarked, is the season designed by Providence for commencing education; but, as ancient and modern languages cannot, consistently with reason and propriety, be taught before our native tongue, our first step must be to make ourselves masters of the language of the country we live in.

Curiosity, sympathy, perception, and association, imitation, analogy, and memory, are the instruments which, with the aid of the language of action, nature employs in enabling a young child to enter into communion with his fellow-creatures. These instruments

may also be applied to the learning of a foreign language in circumstances similar to those in which the native tongue is acquired, but when the learner is differently circumstanced, the natural process not being strictly practicable. the comparative must be had recourse to; and the study of that language is, thereby, placed beyond the reach of childhood. The powers of imitation, analogy and memory, although very active during the whole period of youth, are, nevertheless, inadequate for acquiring all the departments of our language through the written form of another. It is only when the learner can turn his serious attention to particular objects of study, when he can command his powers of comparison, reflection, abstraction, and judgment; when he is able to perform the various exercises required by the method or imposed by his teacher, when the maturity of his mind enables him to understand the authors which may be put into his hands; and when he comprehends the native expressions so completely that they interpret to him their equivalents in the foreign language; it is, we say, only then he can learn that language through his own, or derive any benefit from the periodical lessons of a professor.

The learner, in entering upon his scholastic studies, is, with regard to a second language, in a position widely different from that of the infant who acquires the native idiom instinctively and even unconsciously. One language having already assumed in his mind the exclusive right of representing ideas, its words and idioms come unbidden, and stand in the way of foreign expressions; he has need of firm determination, and of well-directed mental effort to carry him successfully through the study. It is erroneous to imagine, as many persons do, that because children acquire their own language with perfect ease, or because they are endowed with great retentive powers, they have an aptitude for learning languages, and that, consequently, such a study is the fittest for them. Such an error can only arise from a confusion of the *natural* or *practical* method with the *artificial* and *comparative* process. The first, by which the young child acquires the vernacular tongue, demands scarcely any mental exertion beyond that of perception, analogy, association, and memory; the comparative, on the contrary, calls for the co-operation of intellectual energies far above the power of childhood.

The incomplete knowledge which a young child possesses of his own language is, as well as the immaturity of his intellect, an impediment to his understanding foreign authors, and, consequently, a cause of delay and vexation in the prosecution of his study. This is especially the case in the study of the "classics," in which it is very difficult to make him render the profound thoughts and masterly style of the ancient writers, when he has, as yet, conceived only the

simplest ideas, and has at his command only the most familiar expressions. If left to himself, he cannot discriminate between correct and incorrect forms of expression in his own language, and he acquires, by his barbarous translations from the Latin, the most defective habits of speaking. An extensive knowledge of the native words and their various import is required to explain the foreign authors; and this knowledge is gained, not from the nursery prattle, but from a long intercourse with the well-educated, and from a diligent reading of the national standard writers. The young learner may, it is true, with the help of his dictionary, translate every word of his author, but he will not be the less ignorant of his meaning, because a dictionary in two languages only gives the corresponding words without defining them, or illustrating their signification; so that he only substitutes one unknown word for another. Thus, at an early age, many native words come, in translation, under his notice before he has a just conception of their precise meaning; so that they precede in his mind the ideas which they represent—a practice which ought to be carefully avoided, as it accustoms him to take sound for sense, and, as often happens, is calculated to make him, for the rest of his life, an empty talker and a false reasoner. But, should he even understand every word he uses, this exercise is not the end proposed by “classical” instruction; it is to desecrate and degrade the ancient writers, to subject them to literal translation, and make their noblest passages mere parsing lessons. They claim a higher office: the scope of their works, the wisdom of their views, and the beauties of their diction, should be not only investigated and appreciated, but imitated in our modern idiom. Such tasks are far beyond the capacity of childhood. Adults alone can study with profit those masterpieces of poetry, oratory, history, philosophy, and politics.

Children who commence Latin early, are not unfrequently put into Sallust or Virgil at twelve or thirteen, and into Horace or Livy at thirteen or fourteen: how can they, at those ages, comprehend and relish works which, to be properly understood, demand all the mental vigor of manhood and a previous acquaintance with ancient history, geography, and mythology? How can they render thoughts which, to be adequately interpreted, demand a highly improved language and powers of expression which very few persons possess? It is impossible that they could conceive, even with the assistance of their teachers, the elevation of sentiment, the grandeur of thoughts, the boldness of imagery, and the grace of expression with which they are replete. How can they derive profit or pleasure from the readings of Horace or Virgil, or even from modern compositions, such as those of Racine or Voltaire, Dante or Petrarch, Goethe or Schiller, when their ears are not yet attuned to the harmony and

rhythm of verse, when they have neither felt in themselves, nor witnessed in others the passions of the human heart, which these authors delineate? What interest can young children take in highly imaginative compositions in foreign languages, when they are quite incapable of comprehending works of the same standing in their own? Are the works of Milton and Shakspeare fit for American children? To impose such reading upon them is, indeed, to give them the habit of being satisfied with words without ideas!

The important lessons to be learned and the intellectual enjoyments to be derived from ancient literature, are lost to the mature man by the childish conceptions which he associated with the "classics" at school, and by the unpleasant recollection of all the misery attendant on the study. "The flowers of classic genius with which the teacher's solitary fancy is most gratified," says Walter Scott, "have been rendered degraded in his imagination by their connection with tears, with errors, and with punishments; so the Eclogues of Virgil and Odes of Horace are each inseparably allied in association with the sullen figure and monotonous recitation of some blubbering schoolboy."¹ Such are the pernicious consequences of a premature study of the "classics," that Byron, whose mind was so well fitted to enjoy the beauties of Horace, had he read it at the proper time, complains in poetical and bitter strains of the unconquerable dislike with which the scholastic system inspired him for this poet.² Similar observations we find in Lamartine's Pilgrimage to the Holy Land. "Each wave," he says, "brings me nearer to Greece. I touch its soil; its appearance affects me profoundly,—much less, however, than it could have done, if all these recollections were not accompanied by the consciousness that instruction was forced on me to satiety and disgust before I could comprehend it. Greece is to me like a book of which the beauties are tarnished, because I was compelled to read it before I could understand it.—I prefer a tree, a spring under the rock, an oleander on the banks of a river, or the fallen arch of a bridge covered with convolvulus, to the monuments of one of these classic kingdoms, which recall nothing to my mind but the ennui they gave me in my childhood." Certainly, if men of poetic genius, like Scott, Byron, and Lamartine, have recorded their inability in after life to divest the ancient classics of the associations of ennui, satiety, and disgust, caused by their premature study, it cannot reasonably be hoped that boys of mere ordinary capacity will be more successful. This is one reason why the study of the "classics" should be deferred to an age when it is possible for students to read them with intelligence and sympathy.

¹ *Old Mortality*. Pref.

² *Childe Harold*.

and when a greater maturity of mind has enabled them to appreciate their excellence.¹

Now if we consider the resources of modern languages, we will perceive that their study can be commenced at a much earlier age; for their acquisitions, greatly depending on practice and familiar intercourse with those who speak them, suits childhood much better than the exclusive application to books indispensable in the study of the ancient languages. But, were even the study pursued altogether through the medium of books, modern languages could still be acquired at an earlier period than the ancient; for they abound in juvenile works, which, in point of style and information, may be adapted to every stage of early life, and thus afford young people the means of pursuing their studies with pleasure and benefit in various branches of instruction. Ancient literature, on the contrary, is destitute of such compositions. The works commonly called the "Latin Classics" were all composed by men, and mainly intended for adults of their own sex. In the literature of ancient Rome, that is now extant, there is nothing which was written expressly for the young: its volumes are far above the comprehension and tastes of children, and seldom contain information suitable to them; they treat of events so remote, and allude to customs so different from those with which we are acquainted, that they cannot be fully understood, nor can they afford much to interest young minds.

Again, much more thorough proficiency is both attainable and desirable in the modern than in the ancient languages, though many people act as if the reverse was the fact. While the test of knowledge of the modern languages is much more frequent and severe than it can possibly be in Greek or Latin, we have often far too low an estimate of what constitutes a real acquaintance with them. It is not enough to be able to read ordinary books with tolerable facility and a vague notion of their meaning, or to carry on fragmentary conversations about the weather or the dishes at a dinner-table. Fluency both in writing and speaking on subjects grave and various; a full appreciation of the genius and idiosyncrasy of the language, as well as accuracy in its details; an extensive knowledge of its literature; a feeling of being at home in it, if we may so speak—are acquirements which, while they richly

¹ "If the dead have any cognizance of posthumous fame, one would think it must abate somewhat of the pleasure with which Virgil and Ovid regard their earthly immortality, when they see to what base purposes their productions are applied. That their verses should be administered to boys in regular doses, as lessons or impositions; and some dim conception of their meaning whipped into the tail when it has failed to penetrate the head, cannot be just the sort of homage to their genius which they anticipated, or desired." SOUTHEY,—*The Doctor*.

repay the labor that they cost, are unattainable except by long years of study and continuous practice. The spasmodic efforts of a few months, under strong pressure, may do much; but it is by steady, moderate exertion, year after year, that we best become familiar with a living language. In this way only, without any painful sense of drudgery, it grows gradually upon us, and becomes part of our mental being.¹

Languages, learned for the purpose of social intercourse and the practical business of life must evidently be more thoroughly and extensively known than those which are only to be read. With knowledge of a modern language equivalent to that which constitutes an accomplished Latinist of the present age, one would be considered as knowing it but very imperfectly. The good Latinity of the classical scholar passes current only because the true standards of excellence—the orators and writers of Rome—cannot come forward to show the fallacy; whereas the literary men of modern nations place in a manifest inferiority their foreign contemporaries who speak and write their languages. A well-educated person, knowing his native idiom considerably better than the best classical scholar could know a dead language, has it in his power to convey more extensive and more certain information in it, than could be obtained in Latin from any modern Latinist. He may, if allowed sufficient time, carry his pupils to the higher departments of oral and written composition in his native tongue—objects utterly unattainable, at the present day, in the ancient languages.

“I do not think,” says Dr. Jerrard, “that general literature would sensibly suffer, if every Greek and Latin composition that has ever issued from the public schools and universities were thrown into the fire. What should we think of English poems written by Frenchmen or Germans (particularly if their knowledge of English were wholly derived from books), with half the sentiments and

¹ The modern languages which hold the first rank at the present day embrace a larger collection of terms and idioms than are to be found in the ancient. The Latin language, as transmitted to us in the “classics” contains about 25,000 words; French and Italian a little over 50,000. English possesses a more copious vocabulary than either from the proneness of those who speak it to borrow words from other idioms, particularly from the French, and from the facility which it affords of forming compound expressions. As regards this latter source of copiousness, the German language even surpasses the English; for its nomenclature may be almost indefinitely increased by additions to its radical words. Webster’s Dictionary contains 70,000; the Imperial Lexicon, 80,000. In these numbers are not included the different modifications of variable words, the designations of places, or other geographical denominations, nor the names of all animals and plants. Of the latter alone, the French naturalist, De-candolle, has reckoned above 80,000.

phrases vilely borrowed from Milton and Shakespeare, and the remainder consisting chiefly of palpable imitations of their turns of thought or expression? Surely we should have to reverse all our ideas of literary excellence, before we could admire such tissues of plagiarisms as these would be, not to mention how quaint, how ludicrous many of the turns on which the authors most piqued themselves, would appear to us. Such, I cannot help thinking, is the general character of the compositions in question.”¹

But, even admitting that Latin could, at the present day, be written with perfect ease and purity, we do not see how it can be rendered available to any of the various professions in modern society. Certainly he who should now write in a dead language would have little chance of being read and less of gaining celebrity by his “classical” labors. The Latin compositions of Milton, Addison, and Cowley have added little to their fame; the Latin poems of Petrarch are now scarcely known, although he esteemed them above his Italian sonnets and canzones. If Dante had, as he at first intended, written his “Divine Comedy” in Latin, Italy would not boast of him at this day; and his name would have been long buried in oblivion. The same fate would have befallen Ariosto’s poem, if, following Bembo’s advice, he had written it in Latin. Who now reads Sannazaro, Vida, Politian, Bembo, Muretus, Ruggles, the Scotch Buchanan, and other modern Latin authors? The genius of the great writers of a nation is a positive element of its power and greatness; but those who write in a dead language, whatever be the excellence of their performances, add nothing to the glory of their country.

But, say the advocates of “classical” education, the object is no longer writing Latin, no more than speaking it, the practice being now generally abandoned. It is the arduous process of its acquisition which is to show the results; and it has been lately asserted that, even if “classical” studies go no further, and the whole be forgotten of what has so laboriously been acquired, this alone would be an adequate preparation—not for the duties of life, but for the training of mind and heart which is to form the future man, and to fit for those various duties. But to argue thus is to endanger even a good cause by provoking hostility to its more legitimate claims. Reserving ourselves, therefore, the expression of a more exalted opinion of the rich uses to which a knowledge of the ancient languages may be turned, we will here first examine into the arguments generally brought forward in favor of subjecting all, indiscriminately, to a course of “classical” discipline, and see whether the results be really of a nature to compensate the great body of our youth for the immense

¹ *Evidence before a Committee of the House of Commons.*

amount of time and labor spent in the acquisition of what so few care to retain.

In the first place it is advanced that our modern intellectual culture is historically so intimately connected with antiquity, that beyond the claims of mere necessity, at least one of the ancient languages ought to be admitted. But the answer to this is evident; our intellectual culture in modern times has made itself gradually more and more free from the influence of ancient literature, in such a manner that it is now able to stand on its own merits and in a position altogether independent. Those, indeed, whose position in the social system calls upon them to know and to teach not only what the world now is and ought to be, but also how it came to be, what it is, and through what strange mutations and metamorphoses it has passed, may, nay must, go back to the original germs and far-off drawn beginnings of things: but for such as mean only to work on the prepared foundations of modern society, and whose activity is principally directed to the external relations of life, such laborious pilgrimages into the remote past are neither necessary nor expedient. It is to be particularly observed, also, that the ancients, however high they stand in literature and philosophy, are in those branches of science which are most useful at the present day particularly defective; in mathematics and natural history and physics we can learn little from the ancients that will repay the trouble of studying them; and the little that may be learned, is to be learned by him only who can give his whole time to the study of antiquity,—not certainly by a merchant, an agriculturist, or an engineer.

As for what is commonly said that the Latin is the root of most modern languages, and must, therefore, be studied, if not for its own sake, at least for the sake of these, there is a practical fallacy in this too obvious to demand any labored refutation. The time spent in the Latin preparation for learning the modern languages, might have been as well spent in learning the languages themselves. How few, indeed, of those who commencing with Latin, bring it ever so far as to obtain a tolerable mastery of a modern language. And what should we say of the man who, when building a house, first throws away all his money on a magnificent threshold, and then finds that he has been laboriously constructing an entry to nothing? Such, however, is the wisdom of many of those who learn Latin that they may with the greater ease learn French, Spanish, and Italian. But to look into the matter more closely. A large portion of the English is derived to us from Latin, while a larger portion comes from the Teutonic, principally the Anglo-Saxon, as it is called. Leaving out of view this latter portion, with which Latin is not concerned, by far the greater part of the former comes to us through the French. Now

it seems even more natural, as we must of necessity begin with the English, to trace back our words through French to Latin, than to leap over French, returning to it only after we have learned Latin. It is true that Latin well prepares the way for the study of French, which is, in common with the Italian, Spanish and Portuguese, the more immediate descendant of the Latin; but it is equally true that a knowledge of French, or of any of the cognate tongues, greatly facilitates the acquisition of Latin; and we cannot think that the historical order of precedence is sufficient to outweigh the many solid reasons for placing the modern languages before the ancient in the order of study.

Benjamin Franklin, who had only one year's instruction in Latin, when very young, acknowledges that he afterward neglected that language entirely; but having, in manhood, gained an acquaintance with French, Italian, and Spanish, he was surprised, he says, to find, on looking over a Latin Testament, that he understood it better than he had imagined. He adds, "I would offer to the consideration of those who superintend the education of our youth, whether, since many of those who begin with the Latin quit the same after spending some years without having made any great proficiency, and what they have learned becomes almost useless, so that their time has been lost, it would not have been better to have begun with the French, proceeding to the Italian and Latin. For though, after spending the same time, they should quit the study of languages, and never arrive at the Latin, they would, however, have acquired another tongue or two, that, being in modern use, might be serviceable to them in common life."¹

That a knowledge of the Latin is necessary for the acquisition of English is an argument that can scarcely be advanced seriously; for not only is the difference of construction an obstacle to the one being made the standard of the other, but the Latin derivatives which the English language contains, are in comparison with those of Saxon origin, in a decided minority, and even these come, as we have seen, for the greater part through the French. The absence of analogy between the Latin and the English is particularly remarkable in the fundamental principles of their grammars. The predominating character of the English language, both in its grammatical and idiomatic structure, is essentially of Saxon origin. Its inflexions have generally the same source; the English genitive, the mode of forming the plural nouns, the terminations by which are expressed the comparative and superlative of adjectives; the inflexions of pronouns, of the second and third persons, of the preterites and participles of

¹ *Autobiography*. Edited by Sparks. Ch. vii.

verbs; and the most frequent terminations of the adverbs, are all Anglo-Saxon. The manner of expressing the mood and tenses of verbs, the auxiliary words used for that purpose, and the words which most frequently occur, articles, pronouns, adverbs, prepositions, and conjunctions, are almost entirely Saxon. It is in this ancient dialect of the great Teutonic family, and not in the Latin, that the history and genius of the English language are to be studied.

We must equally object to the assertion that the learning of the Latin grammar ensures to the "classical" student a knowledge of his national grammar. When two languages differ much in their genius, the grammar of the one cannot teach the grammar of the other. "Those who say that the Latin grammar teaches English, knowing both grammars, know that they are saying what is not true."¹ It could not, for example, inform us what article to use in English and when to use it, what preposition is required after the verb, and what mood after a conjunction. The definitions alone of grammatical technicalities bear a general resemblance in all languages, and may, then, be tested by reference to Latin or any other grammar; but it is obvious that these definitions can be more clearly illustrated and better understood in the language of the learners than in one of which they are ignorant. Hence it is that the study of the national grammar is a greater assistance to the acquisition of Latin, than that of the Latin grammar is to the improvement of the national tongue.

In favor of the contrary opinion, it is frequently said, that Latin is more strictly grammatical than modern languages, and consequently well calculated to initiate a young person into their principles. This hackneyed assertion, which might have passed current before the existence of modern grammar, is far from being satisfactory, as one of very doubtful meaning, if it have any at all. If it signifies that Latin adheres more closely to grammatical rules, it is unfounded; for, in this respect, all languages are on a par with it, which have a recognized system based on fixed usage. With regard to exceptions from general rules and to idiomatic forms of expression, they are to be found in Latin as well as in modern languages: Terence and Plautus afford many examples of such irregularities, but, were Latin perfectly regular in its grammatical construction, we do not see how its regularity could facilitate the acquisition of irregular idioms. If, by that assertion, it is meant that Latin is more in accordance with the logical principles of general grammar than other languages—that is to say, that the relations which its words bear to each other are more analogous to the relations between their

¹ Westminster Review, Vol. IV. *Present System of Education.*

corresponding ideas, we deny the proposition; for the system of adjuncts or auxiliary words and of juxtaposition, which prevails in many modern idioms, seems more conformable to reason and to the nature of the things represented than the system of inflection and transposition which characterizes the ancient languages. The transpositive collocation of Latin is the order, or rather the disorder suggested by sensation and imagination; the sythetical structure which, in English, and more particularly in French, proceeds from subject to predicate, is the order of judgment and logic.

Knowledge of any native tongue may be carried to a high degree of excellence independently of Latin and Greek. Byron was a mediocre "classical" scholar; he attended the course of studies at Harrow school with dislike and carelessness. He acquired his astonishing copiousness, flexibility, and beauty of expression, by extensive miscellaneous English reading.¹ Madame de Staël and many other celebrated female writers reached the highest walks of literature without previous study of Latin. Richardson and Robert Burns, Rousseau, and Vauvenargues, Bernardin de St. Pierre, and Béranger, learned neither Latin nor Greek. Shakespeare is generally supposed to have been ignorant of a foreign idiom, although some persons believe he understood a little Latin; but to that little, if it be so, it is obvious he owed not his mastery of English. No one will deny that the Greek writers and orators were skilled in their own language, and yet they learned no other in their youth.

It is often said, however, that the thorough grammatical "drilling" in Latin and Greek to which a boy is subjected in the early years of his school-course—the parsing of words, the analysis of the construction of sentences, the comparison of idioms and methods of expression—form an unequalled mental training, and that not merely as a preparation for the more advanced study of the "classic" authors, but wholly apart from any subsequent practical application. Doubtless, a time comes when language must be looked at as an outward thing, be made the subject of actual study, be examined and taken to pieces, and its structure explained and traced to its principles. We also admit that this study cannot be carried on efficiently without a second, or even a third language with which the mother-tongue, so unconsciously learned, may be compared, and whereby it may be illustrated. But then we would ask.—1st. Is not an equal thorough "drilling" possible in French, German, Spanish, or Italian? 2d. If possible, would it not be productive of equally good results? To these questions we have never seen or heard any negative reply which was not opposed alike to reason and to fact, so far as expe-

¹ THOMAS MOORE, *Life of Byron*.

rience has been attainable in this matter. We do not hesitate to affirm that, in so far as thorough "drilling" in all the departments tend to sharpen the faculties, to fix the attention, to strengthen the memory, or to produce any other intellectual advantage, the result would follow equally, in equally able hands, whether the subject-language be French or Latin, Greek or German: except, however, where the ancient text is obscure, in which case the advantage is evidently with the modern,—for the best scholars must confess that there are many passages in ancient writers which they neither do, nor ever can, comprehend; and, in such passages the language fails as an instrument of mental culture. And so it is with all other advantages brought forward in evidence of the utility of "classic" studies: "The allusions to manners, customs, laws; institutions, civil, military and religious; geographical allusions; the fitting of the several parts into a whole, and connecting the several links in the chain of ideas, whether the work under examination be that of an orator, a poet, or a historian; the comparison of parallel passages either from the same writer or from other writers of the same or of different age, country, or language; written exercises, abstracts, and translations; excursions into the field of general criticism,"¹ etc., etc. All this is within the means, nay the duty, of every teacher, be the language of his text-book ancient or modern. A teacher who deserves the name must be able to turn his knowledge many ways, throw it on the instant into very various shapes, continue and illustrate and enforce it with all but endless diversity of association. Such a teacher will not confine himself to the language which is his main subject, ancient or modern; but suiting his lessons to the stage of his pupil's progress, and to the time at his disposal, will point attention to the facts of other languages, and by these illustrate his teaching in the way whether of difference or of resemblance. It is natural that men who have devoted their lives to the study and the teaching of one subject, and who have long been accustomed to view all things in relation to it, should have acquired great facility and dexterity in associating with it all sorts of knowledge. But they err—and the error is honorable to their modesty—in ascribing to the subject much that is really due to themselves. Given an Arnold or a Pestalozzi (the magnitude of the postulate does not affect the conditions of the question), it is of quite secondary importance what language they make the basis of their teaching. Whether it be Greek or German, French or Latin, Spanish or Italian, such men will not fail to edify and delight their pupils with the same clearness in explaining, the same skill in combining and grouping, the same felicity in illustration.

¹ J. PILLANS. *The Rationale of School Discipline.*

But, "modern languages," it has been said, are too like our own in their characteristic features to call forth and exercise the faculties in the same way; while the fact that the classical languages are now unchangeable, that they contain enough for the purpose, and not too much, point them out as most suitable for thus disciplining and strengthening the mind of our youth."¹ We readily admit that, in the comparative study of languages, the more unlike (within limits) those other languages are to the mother-tongue, the greater is the advantage. But this single consideration of unlikeness is clearly not sufficient to determine the choice of a language for comparison or contrast. No one has yet suggested the study of Chinese, as an admirable means of mental discipline for the young. Other considerations then, come into view in deciding the selection; some already have been spoken of, others will be mentioned as we proceed; and without arguing as to the exact comparative degree of likeness or unlikeness, we content ourselves with affirming that French and German are so far unlike English and each other as to furnish abundant matter of comparative illustration, while they possess innumerable points of difference on which to fasten useful and miscellaneous philological disquisitions. The assertion that "the classical languages contain enough for the purpose, and not too much," is one with which we confess our inability to grapple. What is the precise limit between enough and too much? How is it proved or proveable that "the classical languages" contain just enough, while the modern languages contain, too much? And if it be not meant that the modern languages contain too much, what is it to the question between them and the ancient, that the latter contain just enough? But the argument of unchangeableness is so common a fallacy that it merits a brief notice. It is a mere truism to affirm that the "classic" tongues are *now*, that is, henceforward, unchangeable, while the modern tongues are liable to future change; but changes which have not yet occurred are clearly no more to us than changes which never can occur. A language at any given point of its history is just as much fixed as the "classic" tongues are now, that is, as they were when they ceased to be spoken. Our own language, for example, is to us at this moment something equally fixed, whether it shall be exactly the same, or widely different a century hence. On the other hand, the "classic" tongues no more than any modern language, are free from

¹ Rev. JOSEPH ANGUS. "*Four Lectures on the Advantages of a Classical Education, as an Auxiliary to a Commercial Education.*" Unhappily he has failed to convince the very practical Mr. GILBART, who, in his book on Banking, says: "Do not choose a clerk because he has studied for one of the learned professions, for that is no advantage."

the changes which time has wrought in every thing human. Is there no change in the Latin tongue perceptible in Tacitus or Juvenal as compared with Ennius and Plautus? Is the difference much less than that between Chaucer and Cowper? If there be still a classic standard of good Latinity among scholars, so that they can at once distinguish an archaism or a neologism, is there not a similar standard of good "classic" English, or French, or German, at any point of those nations' progress, for example, at this day? If it be said that the travels of at least the young pupil are confined within the middle-zone of "classic" or Augustan Latin, and that he has little concern with the barbarisms of an earlier, or the corruptions of a later, age; so it is precisely with every modern tongue, especially at school. We read Goldsmith, not Gower; Fénelon, not even Montaigne; Schiller's "Lay of the Bell," not the "Lay of the Neibelungen." Besides, there are other changes than those which time introduces. Place, also, has its influence, combined with time, or apart; and when we think of Greek with its Æolic, Doric, Ionic, and Attic dialects, all of which, and especially the latter two, require the careful attention of even the youthful scholar, we can scarcely escape the conclusion that unchangeableness, in any practical sense, is not one of the recommendations of the "classic" tongues.

Nor can we allow any weight to the argument, founded on the number of men eminent in every walk of public life, who have been subjected to the "classical" system of instruction. If the great body of the youth of a country be subjected to any system whatever, not thoroughly mischievous, it is inevitable that a portion of the youth will distinguish themselves; but, surely, it is neither fair nor logical to attribute to the system the splendid success of the rare exceptions, and to pass over in silence the dull obscurity of the mass. Under every system, in spite of every system, without any system, have great men asserted their greatness; and it would be easy, especially in this country, to get up against all schools a case founded on the number of highly eminent men who have received no—what is called—teaching at all. But, even if the habits of attention and application now displayed were fostered by devotion to "classical" studies, it may be still inquired whether those same habits might not have been as well or better fostered under some other system,—better fitted, at the same time to convey knowledge available in the actual business of life. Let us look at West Point, for instance; there no Latin is taught; still its graduates are marked men, wherever they go. The question, then, is not, is the old system productive of, or rather perhaps, compatible with, a certain amount of good; but is it the best system that can be adopted in this nineteenth century for the mental development of the community at

large? Is it in harmony with the wants and with the lights of the age? The fact of its having taken rise at a time when the state of knowledge was so widely different; before the creation of our modern literature—home or foreign; before the vast discoveries of modern science; before the extensive division of human pursuit to which these have led; before men had our better insight into the nature and operations of the mind itself;¹ all this is *prima facie* a strong argument against it,—an argument too strong to be rebutted by the enumeration of a few hundred names whose greatness the system has cherished, or, it may be, failed to crush.

But, it is said, “education consists of two parts—instruction and training; it being the office of the former to impart knowledge, and of the latter to impart mental discipline. It is only the latter that in strictness deserves the name of education; and while all other subjects—a slight exception*being made in favor of mathematics—belong to the instructional division, it is the classical course alone which ranks as educational. Both may, doubtless, be carried on side by side; but still, a decided predominance must be awarded to the latter.” It seems to us that this is a mischievous perversion of a distinction which, in itself, has been long and universally admitted to be just. In the first place, as we have seen on

¹ “The present universities of Europe were originally, the greater part of them, ecclesiastical corporations instituted for the education of churchmen. . . . What was taught in those universities was suitable to the end of their institution, either theology or something that was merely preparatory to theology.

“When Christianity was first established by law, a corrupted Latin had become the common language of all the western parts of Europe. The service of the church, accordingly, and the translation of the Bible, which was read in churches, were both in that corrupted Latin; that is, in the common language of the country. After the irruption of the barbarous nations who overturned the Roman Empire, Latin gradually ceased to be the language of any part of Europe. But the reverence of the people naturally preserves the established forms and ceremonies of religion, long after the circumstances which first introduced them, and rendered them reasonable, are no more. Though Latin, therefore, was no longer understood anywhere by the great body of the people, the whole service of the church still continued to be performed in that language. Two different languages were thus established in Europe, in the same manner as in ancient Egypt; a language of the priests, and a language of the people; a sacred and a profane; a learned and an unlearned language. But it was necessary that the priests should understand something of that sacred and learned language in which they were to officiate; and the study of the Latin language, therefore, made from the beginning an essential part of university education. . . . Universities are the sanctuaries in which exploded systems and absolute prejudices found shelter and protection, after they had been hunted out of every corner of the globe.”

ADAM SMITH, “*Wealth of Nations.*”

a former page, it is a theoretical distinction, and one which regards the ends and the method much more than the means of education. A subject may be studied either for its practical uses, or as a discipline; but every subject or set of subjects brings, in one or other direction, in greater or less degree, its advantage as an exercise of mind. Is the study of arithmetic, for example, when properly taught, less a mental exercise in its peculiar way, because its lessons are of practical service in daily life? Is *utility* sufficient to exclude a subject from the category of *educational* influences? This were an error akin to that of ancient political and economic writers who made productive industry the doom of the slave, idleness the honorable badge of a freeman. But in the second place,—granting that subjects differ greatly in the degree, as well as in the kind of their educational influence, that that subject is entitled to the highest place which exercises in the best way the greatest number of our mental powers, and that neither physical science nor mathematics can claim to take the lead, from want of power, equally to develop and harmoniously to combine the majority of our faculties of mind, while yet some one subject *must* predominate,—we most strenuously contend that it is not to the “classics,” that is to the language of Greece and Rome, but to language and literature at large that this predominance is justly due. A part has been too long allowed to usurp the rank and the honor due only to the whole. In the infancy of modern literature, all literature was represented, and nobly too, by the ancient classics; the one was co-extensive, nay identical with the other; but now the position is widely changed; the relative proportions of the ancient and the modern literature are precisely reversed; still the ancient asserts its old prerogative; it would “lay its ineffectual finger on the spoke of time;” it refuses to believe that the child has grown into a man. In the mean time the native tongue is neglected, the fellow-tongues of Europe are but superficially taught, and at odds and ends of time. Far be it from us to divorce the new from the old; we would give to each a place, gladly acknowledging that each is beautiful in its season. To exclude either, is to condemn the higher study of literature to partiality and incompleteness; still, each must take place according to its relative importance, that being determined by the widest comparison of things, not as they were three, four, or even one hundred years ago, but as they are now. If comparison must be instituted, we maintain that there is no advantage, *intellectual, moral* or *æsthetic*, that the study of the ancient languages can confer, which may not to an almost, if not strictly equal degree, be derived from the study of the modern, while the modern yield peculiar advantages to which the ancient can make no claim.

It is true, the Greeks and Romans were our first masters ; they opened to us the road to knowledge ; but the progress which we have since made has left them far behind us in almost every thing which can contribute to the improvement of society and the comforts of life. The works which they have transmitted to us have no direct bearing on the studies and duties of our generation. Their languages contain but little of practical application and general interest at the present day : whereas those of modern nations are the depositories of a large amount of information, and of such information as is suitable to modern society and indispensable for its various pursuits. The usefulness of living languages will daily increase with the advance of science and the progress of discovery : the exchange of thought, of which they are the international medium for social, industrial, and scientific purposes, will henceforth be an inexhaustible source of public prosperity and advancement in civilization.

The facts which the ancient historians record are less useful to us than those of modern history, because the truths deducible from them are less applicable in our times. The information communicated by the classics is also often inconsistent with our notions of civilization, morality, or religion. By devoting the first period of life exclusively to them, young people are led astray in forming their standard of propriety on these points,—so different from ours were the private and public life of the ancients, their manufactures and commerce, their arts and sciences, their social state, political institutions, and religious worship. At the same time that the study of the poets, orators, and philosophers of Greece and Rome is generally admitted to possess a principle of intellectual development, it is undeniable that the Pagan sentiments and immoral tendencies of some of their writings render them often most dangerous to inexperienced youth. The selfishness of the Romans, and their unqualified hatred for other nations, may be mistaken for love of country ; their aggressive wars and rapine, for true glory ; and thereby tend to elicit in favor of injustice and cruelty the praise and admiration due to patriotism and virtue.

“The custom of teaching children to regard with the highest admiration the literature and history of the Greeks and Romans, stained with outrages on all the superior faculties of man, and of diverting their minds away from the study of the Creator and his works, has had a most pernicious effect on the views entertained of this world by many excellent and intellectual individuals. This is truly preferring the achievements of barbarous men to the glorious designs of God ; and we need not be surprised that no satisfaction

to the moral sentiments is experienced while such a course of education is proposed.”¹

From among the numerous writings showing the evil tendency of an exclusive and incautious study of “classical” literature, we extract the following as deserving especial notice.

“The advocates of these languages always avoid the true view of this question; they urge the absolute merits of classical literature,—which, though not to the extent, is cheerfully admitted,—but never consider what it excludes. I have readily conceded its value as an elegant accomplishment, excepting always where it is tainted with a vicious grossness, and an absurd and most anti-christian mythology. I grant, for I have enjoyed, the taste, the polish, the genius, the poetry, and the oratory of the classics; but I cannot shut my eyes to the gloomy fact that not above one in a hundred, whose years are wasted in Latin and Greek, reap those advantages, or make even an approximation to them; that in after-life, ninety-nine in a hundred, lose the languages, and all their taste, poetry, and oratory, in one general oblivion. . . . Morality is placed upon a false basis of selfishness by the ancient classics; while religion is so utterly opposed to their whole character, that to find them approved and even taught by Christian ministers, can only be accounted for by the habit of not inquiring into long established customs. The talent, health and life wasted on classical studies at college, under the selfish stimulus of college honors, has been often deplored; but the moral consequences are yet worse; there is a familiarity with selfishness and injustice, to which is given the name of patriotism, a disposition to think lightly of war, and an appetite for martial glory, arising from the lessons and intercourse of our public schools, which have a very injurious effect upon society; *so much* is not forgotten by the otherwise oblivious pupil. A different standard of morals and rule of right is, without inquiry by teachers, applied to the ancients and to the moderns, so that sensuality, selfishness, injustice, rapacity, cruelty, and crime, are not only excused to the former, but pressed upon the opening faculties of youth as the constituents of moral grandeur and practical virtue. All this recoils dreadfully upon society. Christianity itself is overborne by a spurious morality, and society continues selfish, sensual and belligerent.

“Eloquence is a wide term; it contains a great deal more in it than is generally supposed. For the application of language to the purpose of strict logical reasoning, splendid imagery, and fine poetry, as infused in eloquence, I should say you could not go to better models than the orators of antiquity. But, when we examine what

¹ GEO. COMBE, *Constitution of Man*.

are the sentiments that are conveyed even by their most splendid orations, we find that these are almost all of a selfish kind, that they tend to flatter and encourage national pride, and the other feelings of a mistaken patriotism, to exclude the bulk of mankind from equal privileges with a privileged few, and to foster feelings of enmity against all other nations but their own, with a very small sprinkling indeed of any thing that we should call high-toned sentiment. I should, therefore, rather look to the orations of Chatham, of Burke, of Wilberforce, of Canning, and of more recent living orators, who deal with justice and mercy, which the ancients knew not, with higher interests and juster views of human nature and human society, and who look abroad upon their fellow-creatures with an eye of benevolence. When I look to their orations, I find in them a much more lofty, a much more genuine, a much more heart-improving eloquence than I have ever met with in the more classical, but less exalted moral effusions of Cicero and Demosthenes. This is felt by those who have listened to such preachers as Chalmers of Scotland and Channing of America, whose eloquence overpowers the feelings to a degree which the orations of ancient orators could not possibly effect."¹

To what we have said of the *intellectual* advantages alleged to follow from the usual course of "classical" instruction, we have nothing to add. We also may limit ourselves to the above remarks concerning the *moral* aspect of the question. Not that we deem it of light importance, but the subject is too extensive for full discussion here, and we have no wish to echo any louder the outcry which has been so generally raised against "classics" on this ground. Suffice it to say, that whatever lessons of virtue and of nobleness an earnest and discerning teacher may draw from the precepts of ancient literature, or from the examples of ancient history,—and they are not few,—not even equality to the modern in this respect can possibly be claimed. Were it otherwise, Christianity would indeed have done little for the world. On the other hand, while the moral harvest of antiquity is scantier, and too often of a coarser grain, the tares are more abundant. A stricter selection and a care more anxious are, therefore, needful; for the mental torpor, which is a sevenfold shield against good, is a poor protection against evil; and what teacher who cares for the heart and the soul, as well as the head of his pupils, has not been dismayed to mark with how prompt avidity precocious vice seizes on what is congenial to itself!

Having thus partially cleared the ground, we are prepared to enter on the closer consideration of the question before us. The great subject of inquiry, be it ever clearly remembered, is not how

¹ JAMES SIMPSON. *Evidence before a Committee of the House of Commons.*

far our modern literature and mental progress are indebted to the ancient classics—a question of purely historical interest; nor even whether the system of “classical” instruction now prevailing do or do not produce some good results by the mental discipline to which it subjects the young, if not by the actual knowledge which it conveys—a question which needs not to be disputed; but whether, regarding the state of present knowledge and the character of the times in which we live, it be necessary or desirable that “classical” studies should absorb so large a portion of the school-years of all our youth. On this subject, the conclusions to which our reflection and experience have led us, are—1st, that the “classics” are taught at far too early a period of life, and that hence arise at once the necessity and the unproductiveness of so vast an expenditure of time and toil—2d, that they are taught too indiscriminately to all, without reference to the future avocations of the learners. These convictions have been forced upon us by our respect alike for the other branches of instruction which “classics” have hitherto much excluded, and for the “classics” themselves, and by our consciousness of their educational value. We cannot too carefully distinguish the ancient classics themselves and their uses, from any system of teaching which may now prevail. We object to the present system that in the great majority of cases neither the ancient languages nor literatures, certainly not the latter, are really learned; that so little knowledge of the inner life of the ancient nations, of their philosophies, their economics, of aught beyond their outward history is conveyed; that the taste for knowledge is too often destroyed by the process of its acquisition; that so few after leaving school ever voluntarily open a Latin or Greek book; that so few have an acquaintance with any authors beyond their class-books; that even in these most have so much difficulty in reading any passage not previously learned; in, short, that their study engrosses needlessly, if not uselessly, the largest portion of the whole school-life of thousands; excludes, or almost excludes, other subjects of equal or greater importance; while it does not produce even within its own sphere the results that might be attained by a wiser distribution of the school-course.

Two leading principles will probably not be questioned—1st, that there are certain subjects which all, whether rich or poor, male or female, absolutely ought to learn; while other subjects, however useful or refining, being relatively less important, may not unreasonably be postponed in favor of those indispensable;—2d, that there are certain subjects which the young mind is better fitted to appreciate and acquire than others which may still have great attractiveness and fitness for a mind more mature. Now, we believe that by a happy provision of our constitution, the same range of subjects

precisely answers to both those preliminary conditions; that is, that the subjects universally necessary are, in their elements, the best adapted to the young mind. Thus the knowledge of external nature, our body itself being to the mind external, is at once the most practically necessary for all classes of society, and the most attractive to the young. It is at a much later period that the mind turns inward on itself, and reflects on its own consciousness. Nature does not more surely direct the child's lips to its mother's breast, than she directs the child's opening mind to observation and imitation of surrounding objects, to experiment upon them, and to the tracing of relations between them and its own being. But these same studies, for such they really are, widening their range with the child's widening faculties, are also the most necessary, nay the most indispensable, for the future lawyer as for the future mechanic, for the future ploughman as for the future merchant, for the youth and for the adult of either sex. Were we even wrong, however, in our belief in this coincidence, it would still be wise to adopt in the choice of subjects taught, the order which nature dictates in the development of the child's faculties. Now the fundamental error of the prevailing system lies in its departing in this respect from the order of nature, and in withdrawing prematurely the attention of the young from sensible realities to abstractions,—from objects animate or inanimate, of nature or of art, to nouns, pronouns, and verbs, on the ground that, of all the faculties of the mind *memory* is that which admits of being earliest exercised, and trained to habits of susceptibility and retentiveness. But it is a great mistake in psychology to suppose that there is any abstract faculty of memory which can be improved by exercise: memory is improved by exercise, not absolutely, but only in the particular direction of the exercise. It is wrong to regard this faculty as a vessel which receives and retains impartially what may happen to be poured into it: it is only what has awakened a child's interest that it remembers tenaciously, and recollects quickly; and only those impressions awaken a child's interest which are adapted to the stage and condition of its mind, which gratify and excite, while they gratify its appetite for knowledge. Now, can it be doubted that it is external objects which most attract and fix the attention of children, and which are consequently most naturally, easily, and permanently remembered? The vast field which has been partitioned among the many departments of modern science, affords most ample materials through the longest school-course for developing as well as storing the youthful understanding, and for arousing the young wonder and sense of beauty;—for we hold with the staunchest advocates of "classical" training, that the mind must be trained and

cultivated as well as stored: only we believe that the subjects just hinted at fulfil both conditions, and that the course of nature is the wisest for the one end as well as for the other.

Besides, if we wish to educate young people, supply them with means of success in future pursuits, and make them useful members of society, we must direct their attention to branches of knowledge which are required in the various avocations of social life. These avocations are now so multiplied, and present so wide a field for competition, that the preparatory studies which they demand, and which are often very extensive, cannot be commenced too soon or pursued too earnestly. On this subject an enlightened advocate of a national education which shall commingle in due proportion the scientific with the "classical" element, finely observes:—¹

"Science existing in the present day, is vastly amplified in all its parts from that which was taught in the days of our fathers. Indeed it is so enlarged, so transformed, that those of us who left the college walls for active life some thirty years ago, find ourselves in quite another world—unable to comprehend its vocabulary, still less its general outline and features.

"In these same thirty years, in which our young republic has pushed out its boundaries till they embrace the whole continental expanse from ocean to ocean, Science with equal ardor and equal vigor has enlarged its territories, till it spreads its wide domain throughout the Earth and the Heavens. Not to speak of the widely extended researches of the analytical chemist—not to advert to the sublime discoveries of the geologist, disentombing and bringing bodily out to attest and record the chronology of the great globe itself, the millions of long buried witnesses, slumbering in stony beds and in more than Egyptian darkness during millions of centuries—not to follow the microscope, descending deeper and ever deeper into the minutest subdivisions of created things, and finding all, from the depths of the deepest oceans to the peaks of the loftiest mountains, filled not only with organized beings, instinct with present life, but innumerable multitudes of the microscopic tenants of our earth in its most remote geological ages,—have we not seen the telescope, with the vast augmentation of its power during these thirty years, pushing far out beyond the solar system, ascending into the countless systems and series of systems of the stellar worlds—unfixing the fixed stars themselves, and tracing their wanderings through the sublimest fields of time and space? Nay more, is not the upturned eye of the awe-struck astronomer even now, at this very moment, with that same telescope of these modern days, pene-

¹ S. B. RUGGLES. *Address in behalf of a National University*, March, 1852.

trating through the tangled wilderness of suns and stars, and piercing deeper and deeper into the vast abysses of the universe, detecting infant, new-born worlds, in the very act of coming into being! And yet all this science, disclosing truths thus august, achieving discoveries thus sublime, comes down daily with its homely and practical application to the ever-varying wants and necessities of Man. Never at any former period in human history have its useful applications been so constant, so valuable and so numerous. Not only has it gladdened all earth and man by its applied results, but it has extracted new powers from elemental nature, and delivered them over to the service of our race. The ruder, the grosser, the more palpable mechanical powers which had sufficed since the earliest antiquity for our use—even the great and all-pervading power of gravitation itself, are, one and all, superseded by a band of laborers, snatched from the Heavens, brought down and subjugated, and made to toil as the slaves of man. For was it not reserved for our day and generation to witness the crowning achievement of science—its brilliant and matchless victory over the imponderable agents of Nature?—agents so ethereal, so delicate, so evanescent,—and yet so faithful, so efficient, so untiring?

“And when did Man ever possess a better set of servants? Is there any office or any use, however exalted or however humble, to which these heaven-born agents are not applied? Are they, indeed, the companions only of the learned philosopher, the curious student? Does not that same vivid, electric fluid, which carries on its wings Thought, Eloquence and Genius, condescend to enter the shop of the plodding artisan, and actually plate the very tea-pot on his table? And is not light, polarized light—so exquisitely analyzed as to detect the occult laws of the far distant stellar worlds—placed by the philosopher in the hands of the lowly sugar-boiler, that he may send it in as one of his daily workmen to watch Nature herself in her most secret process of crystallization? Do we not discover at every step, and in every direction, increasing proofs of the hidden harmonies of the Sciences themselves—their indissoluble connection each with all, and the necessity, the indispensable necessity, of all to the service of their master, Man?

“The question, then, for an intelligent community like ours, willing, at least, to benefit its material condition is this—Shall science, so exalting and yet so useful—so sublime, yet so humble, be monopolized by the learned few, or shall it belong to all the people, and be distributed in the largest and most liberal measure among all alike? We think they can give but one answer. We think they will claim, as they may lawfully claim, the same inherent, primary, fundamental right to knowledge, which they claim to liberty itself;

and will take due care that nothing shall stand in the way of their acquiring this, their greatest treasure."

The advantages which may arise in active life from the various branches of knowledge here alluded to, are obvious. Those which may be derived from Latin and Greek are, if we except the mental discipline effected by the study of a foreign idiom, very inconsiderable. In adverting to "classical" instruction, Adam Smith observes:—"It seldom happens that a man, in any part of his life, derives any conveniency or advantage from some of the most laborious and troublesome parts of his education."¹ And yet those languages usurp the almost exclusive right of occupying, for several years, the rising generation, those on whom the country places her hopes of advancement in the different pursuits which contribute to her wealth, prosperity and glory.

Not only do the dead languages present but little chance of being applied to any useful purposes in after-life, but the mental training which their acquisition may promote, although of a high character, cannot supply all the intellectual wants of society. The discipline which arises from the comparative study of ancient languages leads to particular attainments, which, valuable as they are, ought not to be the only objects of ambition in intellectual education. A different course of mental training is required to prepare the mind for the scientific, military, and industrial professions, from that which is calculated to produce great scholars. The habits of the mind formed by the study of Latin and Greek, have contributed but little in raising to eminence those who hold the highest rank amongst legislators, warriors, navigators, engineers, agriculturists, manufacturers, merchants or artists. It is not these languages which have brought out the mental energy of the great benefactors of mankind, of those who, by their inventions and discoveries, have increased, and daily increase, the power and well-being of man.

The present tendency of society is to special and professional education; and such education cannot be obtained through the "classics." Our ancestors could not avoid confining their youth to the narrow circle of what were, in their time, aptly called, "the learned languages;" because, as already remarked, they had little else to teach them, and that little was to be found in those languages. "But though wisdom in them, it does not follow that it is such with us. With them it was knowledge, not for ornament, but use. It was the instrument of *action*, as well as of *thought*. Law, Diplomacy, Medicine, Religion, all was Latin: a man who was no 'Latiner,' was a mere villein in education: he was deemed unfit in

¹ *Wealth of Nations*

civil life for any situation destined for the 'ingenuous' and free. But to insist on it at present, but, above all, as the only thing necessary, and to the sacrifice of many other things really so, is a folly of which our ancestors could not have been guilty."¹

It is wonderful how far our thoughts and acts are influenced unconsciously by mere verbal fallacies. If the word *learning*² means obsolete vocabularies and antiquarian lore, it may indeed be applied to ancient literature; but if, as we believe, it means science, history, philosophy, literature in general, it seems hardly proper to apply the term to the acquisition of Greek and Latin, and to call these languages *learned*, when scarcely any kind of available information can be obtained through them. Those alone are truly *the learned languages* which are depositories of useful knowledge. Almost all the Greek and Latin works which contain information of any value, have been translated, and are thus accessible to persons ignorant of those languages; but from the modern press there are issuing daily, in various countries, works of merit in every branch of literature, and in every department of knowledge, many of which ought to be read as they appear. No physician, chemist, or engineer,—no scientific man, in fact, can attain to eminence, or even keep pace with the progress of science or art, who cannot avail himself of the discoveries and improvements made by other nations on subjects relative to his pursuit. Living languages are indispensable to travellers, merchants, and statesmen, to diplomatic and consular agents, to naval and military men, to the man of fashion, as to the man of science; whereas the usefulness of the ancient languages, viewed either as stores of knowledge, or as means of communication, is at the present day very limited.

Utility is the test by which the value of instruction ought to be estimated; and the study of words is useful only so far as it leads to the acquisition of things. "Language," says Milton, "is but the instrument of conveying to us things useful to be known. And,

¹ TH. WYSE. *Education reform.*

² There is much obscurity and dispute comprised in these terms (literature and taste)—many fallacies dependent on them. But the great fallacy of all is in the term *learning*. Learning! a learned man! a scholar! these are words that blind us, and maintain in folly what was laid in wisdom. Once, Greek and Latin were the only learning, words the only sciences. The unhappy term remains; the country of England still considers syntax and quantity as learning, and the consequences are obvious. When nonsense verses shall have taken their appropriate place with charades and logogryphs; when politics, laws, economy, morals, mathematics, mechanics, chemistry, shall be dignified with the term "*learning*," then will Britain, and Europe with it, see that revolution in its education and its creeds, to produce which we trust we are not writing on dead leaves, and to the winds."—WESTM. REV., Vol. 4., "*Present System of Education.*"

though a linguist should pride himself to have all the tongues that Babel cleft the world into, yet if he have not studied the solid things in them as well as the words and lexicons, he were nothing so much to be esteemed a learned man as any yeoman or tradesman competently wise in his mother dialect only." ¹ Those languages should be preferred which afford the most abundant means of gaining knowledge. A second language is not of itself knowledge; it is only an instrument for obtaining and conveying it. Having two words for every thing,—two ways of expressing every idea, does not constitute real information. He who knows ten names for a plant is less informed than he who has only one name for it, but is acquainted with ten properties of it. The time which is given to the study of words is often taken from the study of things: hence it is not rare to find persons masters of several languages, who, notwithstanding, are very ignorant.

If schools and colleges were, as they ought to be, an introduction to the world; if their method of training embraced the cultivation of all the mental powers; if their course of study were a preparation for the various avocations and active duties of life; and if the instruction received in them were available in manhood, they would present some prospect of advantage to every class of society. Unfortunately this is far from being always the case. The time given in many of them to any thing beyond the ancient languages and mathematics, is, indeed, very inconsiderable. The mnemonic exercises on the national grammar, on geography and history, and the instruction on the natural and experimental sciences, which are occasionally introduced, may satisfy those who have not reflected on what constitutes good education; but they do not supply the real wants of the generality of learners, nor do they enable them to fulfil the expectation of society concerning its future members. Every information, in fact, beyond the "classics" is secondary: it is attended to with indifference, and often with ill-will; it is studied merely as a matter of form, and to save appearances. This *exclusive* attention to ancient literature, by indirectly contemning the native and foreign living idioms, leads young people to disregard their national and other modern classics. It narrows their minds and destroys their individuality by making them the servile imitators of the ancients.

Under the influence of these antiquated notions, a young man, after the period of scholastic education, is ushered into the world with a smattering of one or two dead languages, and with but scanty knowledge of his own; with vague notions of bygone ages and utter

ignorance of passing events. He is apt to entertain an exalted opinion of "classical learning," and a total disregard of modern sciences and practical good sense.¹ No wonder, then, that so many eminent men have raised their voices against the present scholastic course. Dr. Arnold himself, who was so conversant with the details of instruction in "classical" schools, condemns it as altogether inefficient: "Our intellectual eminence in modern times," he says, "by no means keeps pace with our advances in all the comforts and effectiveness of society. And I have no doubt that our miserable system of education has a great deal to do with it."²

Industrial pursuits are the foundation of our social and political organization, the source of the prosperity of the state, and the means of existence of the great majority of citizens: the arts and sciences, on which they depend, ought to form an essential part of our education. Let, then, the practical sciences be imparted in our schools and colleges as they are in active life. Although of comparatively modern origin, they rank high in the scale of knowledge, whether we consider their usefulness, the comprehensiveness of their aim, or the unerring certainty of their principles. No scientific pursuit has more largely than natural philosophy, and its handmaid, chemistry, supplied the wants and luxuries of life, promoted the health and comforts of the human race, and contributed to the improvement of agriculture, manufactures, and the arts of modern civilization. The sciences which reveal the laws and phenomena of nature possess this inestimable advantage in the education of youth, that their study presents striking and endless manifestations of the infinite power, wisdom, and benevolence of God.

The external world of material objects displays the power of the supreme Architect who created it, not less than the internal world of thought. Matter and intelligence are the inseparable elements of

¹ It is to the great body of men of this description that Prof. Faraday alludes in the following passage from his letter on Table-turning:—"By the great body—I mean such as reject all consideration of the equality of cause and effect—who refer the results to electricity and magnetism, yet know nothing of the laws of these forces—or to attraction, yet show no phenomena of pure attractive power—or to the rotation of the earth, as if the earth revolved round the leg of a table—or to some unrecognized physical force, without inquiring whether the known forces are not sufficient—or who even refer them to diabolical or supernatural agency, rather than suspend their judgment, or acknowledge to themselves that they are not learned enough in these matters to decide on the nature of their action. I think the system of education that could leave the mental condition of the public body in the state in which this subject has found it, must have been greatly deficient in some very important principle."—*Athenæum*, July 2, 1853.

² *Life and Correspondence*, by A. P. STANLEY.

one grand whole. It is, in fact, by the contemplation of the former that man can exercise and unfold his portion of the latter. Nothing is better calculated to enrich the mind and to elevate the soul than the attentive consideration of those admirable principles of nature, which diffuse every where an indelible character of order and beauty, proclaiming unity of design, in variety infinite, and manifesting the divine impress of the Creator. Nothing is so capable of exciting human inquiry to continual activity as these sublime problems of nature, the solution of which opens wider fields of thought with every new discovery, and exhibits the relations which exist between the physical and the moral world.

In truth, it is now beginning to be perceived that the scientific element should enter more largely into our religious teaching, hitherto confined almost exclusively to "classics." It will be fortunate for the Church not less than for Science, if the importance of their more perfect union, so forcibly expressed by an eminent writer already quoted,¹ shall come to be universally admitted.

"In asserting," says he, "that the Church produces few great scientific teachers, I only state a fact deeply to be deplored, for it is Her peculiar office to watch the progress of human thought, to guide, promote and consecrate the intellectual labors of man. Five hundred years ago, when the intellect of Christendom was abandoning Scholasticism for the newly opened field of classical learning, the Church forgot her duty. Lagging behind the age, she by turns opposed and feebly encouraged, what we now see was the great movement of the time. She alienated its leaders, and allowed Thought and Letters to get beyond her influence, and the Christian world still suffers from the disastrous mistake."

"We are now in the midst of another intellectual revolution, no less momentous. Man is hourly gaining mastery over Nature, developing her hidden laws, and subduing to his service her hostile powers. Physical Science, the splendid instrument of modern progress, must become, if it be not already, the controlling study of the age. Should the Church be longer indifferent to such an element? Is she at liberty to disregard it?"

"Distrusting modern science, and avoiding contact or sympathy with its leaders, she has thus far denied herself the power she was entitled to exert over the nineteenth century. But recent indications lead us to hope better things for the future. Signs of concord and coöperation begin to appear, and the time has not yet passed, for the Church to bring into her ranks,—where they belong,—the potent energies of modern science.

¹S. B. RUGGLES. 1854. *The Duty of Columbia College to the Community considered by One of its Trustees.*

“For distrusting the study of the Classics, and omitting actively to encourage the ‘Revival of Letters,’ the Church at the time had some apology. Clearly as we now perceive the beauty and value of Ancient Learning, and its fundamental importance as an element of sound education, we cannot wonder that she hesitated, before admitting heathen philosophy and poetry into her religious teaching.

“But a reverent study of the Works of the Creator can only strengthen the position of the Church, and furnish cumulative evidence of the truths she teaches. The laws of Matter have been consecrated by her Divine Founder to the good of the human race. In healing the sick, and multiplying food for the starving, He showed the Church her duty to care for man’s material wants, and use for his material welfare all the powers of material nature.

“Is it not, then, matter of profound regret, that the Church should deem it unimportant to enlarge to the uttermost our knowledge of the wide-spread wonders of God’s Material Creation?—that it should fail to perceive the immensity of the truth, embodied in the Universal Liturgy, which proclaims not only Heaven but Earth “full of the Majesty of His Glory?”¹

Blind respect for the monachal institutions of the old English universities has strangely perpetuated the vices of a system of instruction which contrasts so obviously with the progress that science, art, and philosophy are making on all sides. The instruction of youth should, like the laws, change with the character and institutions of a nation; it should follow its moral and intellectual progress, and should be extended with the increasing demands of the people. The little progress which the ancients made in the physical sciences, did not permit them to perceive the intimate union which exists between

¹ It is well worthy of notice that, while the churchmen in America are thus contending for the necessity of physical science as an element of religious culture, like efforts are made by their lay brethren in England. At the last annual “Commemoration” at Oxford, the Earl of DERBY, the Chancellor of the University, in an official address, strongly expressed his opinion in favor of introducing the natural sciences into the course of study. He especially warned the Clergy that “they would incur loss of respect unless they acquired knowledge so interesting to the bulk of their flocks.” In alluding to the two dangers which were apprehended from the introduction of the study of the physical sciences into the Oxford *curriculum*, first of displacing the old studies, and second, that the new would be studied only superficially, he stated that he had no serious fears of either. He concluded with an eloquent vindication of the uses of the study of the works of God in the physical creation, introducing with great appropriateness and effect a part of the beautiful morning hymn of praise which Milton puts in the mouth of our first parents.

It is quite evident that Oxford, so long the stronghold of mediæval traditions, must yield ere long to the higher civilization of modern times.

the sciences and the arts. In their ignorance of political economy, they despised agriculture and manufactures, unaware of their influence on civilization. Among them the mechanical and industrial arts were abandoned to slaves. Xenophon affirms that such occupations corrupt man; Aristotle denies to those who are engaged in them the right of franchise; Plato, who, in his Republic gives the first place to musicians, proposes to punish the citizens who should carry on commerce. In the Middle Ages the useful arts were the occupation of bondmen exclusively; they were neglected by the enlightened portion of the community, and could therefore receive but little improvement. But now that they are carried on by freemen, and are ennobled by the sciences and arts to which they owe their birth and perfection, their study must necessarily form part of a general system of education.

We conclude our remarks with the following extract from one of our public journals, in which it is very appropriately headed,—*“A noble Speech by Prince Albert.”*⁴

. “It has been a great pleasure to me to have been able to participate, in however trifling a degree, in a work which I do not look upon as a simple act of worldly wisdom on the part of this great town and locality, but as one of the first public acknowledgments of a principle which is daily forcing its way among us, and is destined to play a great and important part in the future development of this nation and of the world in general—I mean, the introduction of science and art as the conscious regulators of productive industry. The courage and spirit of enterprise with which an immense amount of capital is embarked in industrial pursuits, and the skill and indefatigable perseverance with which these are carried on in this country, cannot but excite universal admiration; but in all our operations, whether agricultural or manufacturing, it is not we who operate, but the laws of nature, which we have set in operation. It is, then, of the highest importance that we should know these laws, in order to know what we are about, and the reason why certain things are, which occur daily under our hands, and what course we are to pursue in regard to them. Without such knowledge we are condemned to one of three states:—Either we merely go on to do things just as our fathers did, and for no better reason than because they did them so—or, trusting to some personal authority, we adopt at random the recommendation of some specific, in a speculative hope that it may answer—or, lastly, and this is the most favorable case, we ourselves improve upon certain processes; but this can only be the result of an experience hardly earned and dearly

⁴ Delivered on occasion of laying the corner stone of the Birmingham and Midland Institute, Nov. 22d, 1855.

bought, and which, after all, can only embrace a comparatively short space of time, and a small number of experiments. From none of these causes can we hope for much progress; for the mind, however ingenious, has no materials to work with, and remains in presence of phenomena the cause of which are hidden from it. But these Laws of Nature—these Divine Laws—are capable of being discovered and understood, and of being taught and made our own. This is the task of science—and while science discovers and teaches these laws, art teaches their application. No pursuit is, therefore, too insignificant not to be capable of becoming the subject both of a science and an art. The fine arts, as far as they relate to painting and sculpture, which are sometimes confounded with art in general, rest on the application of the laws of form and labor, and what may be called the science of the beautiful. They do not rest on any arbitrary theory on the modes of producing pleasurable emotions, but follow fixed laws, more difficult, perhaps, to seize than those regulating the material world, because belonging partly to the sphere of the ideal and our spiritual essence, yet perfectly appreciable and teachable, both abstractedly and historically, from the works of different ages and nations. No human pursuits make any material progress until science be brought to bear upon them. We have seen, accordingly, many of them slumber for centuries; but from the moment that science has touched them with her magic wand, they have sprung forward and taken strides which amaze and almost awe the beholder. Look at the transformation which has gone on around us since the laws of gravitation, electricity, magnetism, and the expansive power of heat have become known to us! It has altered our whole state of existence—one might say the whole face of the globe! We owe this to science, and science alone; and she has other treasures in store for us, if we will but call her to our assistance. It is sometimes objected by the ignorant that science is uncertain and changeable; and they point to the many exploded theories which have been superseded by others, as a proof that the present knowledge may be also unsound, and after all not worth having. But they are not aware that while they think to cast blame upon science, they bestow, in fact, the highest praise upon her. For that is precisely the difference between science and prejudice: that the latter keeps stubbornly to its position, whether disproved or not, while the former is an unarrestable movement toward the fountain of truth—caring little for cherished authorities or sentiments, but continually progressing—feeling no false shame at her shortcomings, but, on the contrary, the highest pleasure when freed from an error, at having advanced another step toward the attainment of Divine truth, a pleasure not even intelligible to the pride of ignorance. We

also hear, not unfrequently, science and practice, scientific knowledge and common sense, contrasted as antagonistic. A strange error! For science is eminently practical, and must be so, as she sees and knows what she is doing; while mere common practice is condemned to work in the dark, applying natural ingenuity to unknown powers to obtain a known result. Far be it from me to undervalue the creative power of genius, or to treat shrewd common sense as worthless without knowledge. But nobody will tell me that the same genius would not take an incomparably higher flight if supplied with all the means which knowledge can impart, or that common sense does not become, in fact, only truly powerful when in possession of the materials upon which judgment is to be exercised. The study of the laws by which the Almighty governs the universe is therefore our bounden duty. Of these laws our great academies and seats of education have, rather arbitrarily, selected only two spheres or groups (as I may call them) as essential parts of our national education—the laws which regulate quantities and proportions, which form the subject of mathematics, and the laws regulating the expression of our thoughts through the medium of language, that is to say, grammar, which finds its purest expression in the classical languages. These laws are important branches of knowledge; their study trains and elevates the mind. But they are not the only ones, there are others which we cannot disregard—which we cannot do without. There are, for instance, the laws governing the human mind and its relation to the Divine Spirit—the subject of logic and metaphysics. There are those which govern our bodily nature and its connection with the soul—the subject of physiology and psychology. More which govern human society and the relations between man and man—the subjects of politics, jurisprudence, and political economy, and many others. While of the laws just mentioned, some have been recognized as essentials of education in different institutions, and some will, by the course of time, more fully assert their right to recognition, the laws regulating matter and form are those which will constitute the chief object of your pursuits; and as the principle of subdivision of labor is the one most congenial to our age, I would advise you to keep to this specialty, and to follow with undivided attention chiefly the sciences of mechanics, physics, and chemistry, and the fine arts in painting, sculpture, and architecture. You will thus have conferred an inestimable boon upon your country, and in a short time have the satisfaction of witnessing the beneficial results upon our national powers of production. Other parts of the country will, I doubt not, emulate your example, and I live in hopes that all these institutions will some day find a central point of union, and thus complete their national organization.”

This admirable speech which so well sums up the views above expressed, deserves the more our attention, as, from the eminent character of the speaker, as well as from the occasion on which it was delivered, it expresses the state of public sentiment in a country which we have too long copied in its errors,¹ not to follow it now in the way of reform. This reform, indeed, has already commenced among us, and is more likely to be carried out in those schools and academies which emanate directly from the people. Convinced that the old Grammar-schools in which Latin and Greek are exclusive or preponderant, however useful as preparatory palæstræ to philosophizing clergymen and leisurely gentlemen with large libraries, are not the schools for them, they have established their own institutions, with a view to the greatest advantage for the student and the greatest public utility.² In these schools the sciences and modern languages are seen to flourish side by side with the "classics," and in many of them such an amount and such a variety of knowledge are now communicated, with such an admirable discipline of the understanding of the powers whether of observing or of reasoning, as well as of the taste for what is beautiful in literature and art, that the elder colleges must take serious heed lest their sons be sadly beaten in the educational and social race.

¹ In mentioning how in the origin we were obliged to content ourselves, in matters relating to science and literature, with imitating the mother-country, Mr. SILJESTROM remarks:—"This imitation is also evinced in the constitution of their learned institutions, particularly of their colleges which have been organized after English models. As in England, so in America, these institutions are little more than seminaries for teaching classical languages and mathematics: all other subjects are considered as subordinate and treated with more or less negligence. . . . Idolatry of the classical languages is as common in the new world as in the old; only it appears even more preposterous in America in the midst of the fresh life of a new community. . . . I entertain the conviction, that as long as classical pedantry, which still prevails in the higher educational institutions, be not got rid of, and a more popular system of government be introduced, these institutions will never exercise that influence on the scientific culture of the nation as under other circumstances they might and would exercise. I have no doubt, however, that gradually, as the public school system extends its action to higher spheres, the system of instruction will adopt a new and more effective form."—*The Educational Institutions of the United States*.

² See *Report of N. Y. Board of Education*. May 3d, 1848. "The Report recommended the establishment of a *Free College or Academy*, and presenting its design, nature and objects in this language: "Your Committee will not at present enter into the details of the proposed institution, but will briefly remark that their design is to offer the idea of a college, which, while it shall be in no way inferior to any of our colleges in the character, amount, or value of the information given to the pupils, the course of studies to be pursued will have more especial reference to the active duties of operative life, rather than to those more particularly regarded as necessary for the pulpit, bar, or the medical profession."

Sharing the conviction that the classes for whom a few years' schooling is the utmost they can attain, ought not to be deluded and mocked with the rudiments of "classical" instruction, which they can never carry onward to utility and enjoyment, but are entitled to a solid groundwork of practical, useful knowledge,—a work quite compatible with the development of refined taste and feeling—we have sought to show the inexpediency of introducing the ancient languages at an early stage of instruction. But, as much as we are opposed to a too early or exclusive study of "classical" literature, we should equally regret to see our reasons perverted into arguments against "classical" studies in general. Let us well distinguish the use from the abuse. If Latin and Greek be unprofitable to the great majority of students, it does not, therefore, follow, as some eager innovators will have it, that Homer and Virgil are to be banished from our public schools altogether, and steam engines and calculating machines substituted in their place.—Let it not be!—Let us not snap cruelly the golden chain that has so long and so pleasantly bound us to the past!—Let us not unbridge the mystic gulf of centuries profanely!—Let Virgil and Homer live, as good things, and among the best, for those who have time and capacity to "drink deep of the Pierian spring,"—but let them not be wasted in mere rudiments and disciplinarian externals. Let the study of ancient literature be reserved for the higher class in school, for those whose mind has grown mature, and become capable of comprehending the objects which it contemplates, and the "classics" will again assume their rank and dignity, now so seriously compromised by their indiscriminate application.¹

The Greeks and the Romans amply made up for their extreme deficiency in the sciences by their taste in the fine arts, and the exquisite finish of their literary productions: hence their languages afford advantages which cannot be denied. The noble specimens of history, oratory and poetry embodied in them, present the fairest models of composition; the excellences with which they are replete effectually cultivate and polish the taste of students in all literary subjects; whilst the habit of explaining and analyzing thoughts relative to a state of society so different from the present, inures to intellectual research, and calls into action reflection, imagination, and judgment. The peculiar system which characterizes

¹ "Nothing has more contributed to disparage the cause of "classical" education than the rendering it the education of all. The ancient languages are taught at once too extensively and not intensively enough." *Edinburgh Review*.

the grammatical structure of those languages, the distinctive terminations of the same species of words, and the changes of those terminations, incident to the various circumstances in which they are used, as well as the indefinite collocation arising from these changes, afford to the more advanced learners favorable opportunities for prosecuting their study of the native tongue, for acquiring a thorough knowledge of general grammar, and exercising the mind in philological investigations. Being also the source from which several modern languages are derived, and from which the technology of science is formed, they show the affiliation of those languages, explain scientific nomenclatures, and open a wide field for etymology.

But the main advantage of "classical" studies results from the essential character of ancient literature in thought, and emotion, and expression. As in addition to the simplicity and tangibility of their contents, and their less complex character generally, the works of the ancients stand unrivalled as models of purity in style and truth in art, their careful perusal will serve as a most salutary check against that looseness, ill-regulated luxuriance and extravagance, by which the compositions of modern literature have too frequently been characterized. It should also be remembered, in estimating the influence which the pattern specimens of ancient literature exert on the modern mind, that we are placed in very different situations and surrounded by very different circumstances, and that, for this reason, there is much less danger of a slavish and passive imitation of antiquity, than of a modern model. An ancient model will be admired, and exercise a beneficial influence on the taste of those who admire it; but as it does not excite, and is not meant to excite to any imitation of exactly the same kind, it seems to stimulate exertion without inciting a discouraging comparison. The classic models of our own literature, on the other hand, stand so near to us, and so obviously incite comparison with our own performances, that a servile imitation, or a despairing abandonment of self-development, is too apt to be the result of the early admiration which is fixed on them.

And let it not be said that the benefits expected from classical literature could be equally obtained from good translations. The *substance* of the historical, oratorical, or other didactic works of the ancients may, it is true, be conveyed in faithful translation; but the *pith* of their expression can never be conveyed. In imaginative composition, especially, the very form in which the classical writers moulded their creations is nearly as essential as the substance, and that form cannot be transferred into another language. No interpretation of the standard classics can give an idea of their energy,

or of their peculiar grace. A translation may be full of beauties; but they will be of a different character from those of the original. By translation, the harmonious arrangement of words, the excellences of style, are lost, especially in poetical productions, which become sometimes unintelligible and nonsensical. The impossibility of transfusing into one language the beauties of another, makes a translation unfit as a model: original works should always be preferred. Seldom have the most celebrated and the most admired works of any nation obtained, in the translation, popularity equal to that which they enjoy in the original. This is particularly the case with the literary master-pieces of antiquity.

Ancient languages must continue to occupy a large share of attention in the intellectual education of young men destined for pursuits which depend on literary acquirements. It is a narrow view to consider them as useful only to the learned professions. If an acquaintance with them is beneficial to the clergyman, the physician and the lawyer, it is not less so to the archæologist, antiquarian, statesman, philosopher, and man of letters; for they are the interpreters of ancient monuments and coins, the original receptacles of our laws and of ancient doctrines, the inexhaustible sources of our modern dialects, and the bonds which mentally connect modern nations with one another and with antiquity.

“Classical” literature must be studied in proportion to the influence it has had over modern civilization. This study ennobles the mind by elevating it above the trivial pursuits of ordinary life, and affording means of intellectual culture. Let us never forget that, through the writings of antiquity, the ideas of freedom entertained by the republics of Rome, Athens, and Sparta, have cast deep roots among the enslaved nations of modern times; and liberty has left her ancient temples to place herself at the head of civilization. The judicious study of the ancient languages will preserve these feelings in the hearts of men, and will associate liberty with education. “Classical studies maintain the sacred tradition of the intellectual and moral life of humanity.”¹

We may therefore assume that for him who wishes to reach the highest point of intellectual cultivation, an initiation into ancient literature is absolutely indispensable. Only when so initiated is he in a condition to survey comprehensively, to contemplate clearly, and to see profoundly into what human nature under its various aspects can achieve; by the aid of ancient learning alone is the educator enabled to extend his view beyond the narrow horizon of the now which encompasses him, and to distinguish between that which

¹ V. COUSIN. “*Rapport sur l’Instruction publique en Allemagne.*”

is merely local or temporary, and that which is of universal and human significancy. And it is only this extent of vision which entitles a man to say that he is educated in the highest and complete sense of the word.

But here a question of great practical interest arises. Can the "classics" be taught efficiently, if delayed to a later period of the school course, precedence being given to the modern languages? We do not hesitate to reply, that the efficiency would be increased, not diminished, by the delay. It is, doubtless, a paradox to contend that the time may be abridged, and yet the result not lessened, but augmented; but every one knows how much more can be effected by the well-directed energy of a day, especially when the mind is somewhat mature, than by the half-hearted dawdling of a week, especially in earlier and more careless life. If this seem to any inconsistent with what we have before said about the length of time being required for attaining perfect familiarity with a modern language, let them remember what we have also said, first about the greater fitness of modern languages for early study, and secondly, about the quite different manner and kind of proficiency which, in a modern language, is both to be desired and to be obtained. Besides, it is not the higher "classic" teaching that ought to be curtailed; it is the rudimental drudgery that ought to be abridged and condensed by better methods,¹ and above all, by waiting nature's time. It is the early age at which "classical" studies are begun, that—rendering the work at once tedious and unprofitable—necessitates so wasteful an expenditure of time, and prevents their successful prosecution. Difficulties which are now surmounted, if at all, with infinite labor and many tears; details which are now mastered, if at all, by children who can have so little comprehension of their meaning and purpose, and so little motive to mental effort; would afford only an easy and a pleasant exercise to minds more mature and better prepared.

At all events, since the physical sciences on one side, and the modern languages on the other, have inserted their various wedges into the "old classical system," it has become obvious that it cannot, in its integrity, much longer be upheld; and various modifications have been suggested to meet the wants of the age. Generally, two divisions—one embracing the ancient, the other the modern languages—have been instituted from the first stage, and maintained throughout; one school being thus, in fact, made into two, coinciding in all other points. It is not necessary that we should dwell on

¹ "We do amiss to spend seven or eight years in scraping together so much miserable Latin and Greek as may be learned otherwise easily and delightfully in one year."—MILTON, *On Education*, to Sam. Hartlib.

the defects of this plan, which is, indeed, a virtual abandonment of the whole "classical" ground in the case of all but those who have some special reason for "classical" study. It leaves the "classical" student where he was; it cuts off the other from the "classics" altogether; it deprives both of the advantage of a joint training, and is apt to create invidious distinctions. Still it was the first step made. An improvement on this has been the introduction of a modern language, during the last year of the school-course, with all who have followed the "classical" routine; and that this previous training gives them peculiar facilities in the acquisition of the former—especially if it be one of the more immediate descendants of the Latin—cannot be denied, though a few months, even under those circumstances, can hardly do more than laying a good foundation. But, as this is done to the detriment of the "classics" themselves, which are thus neglected at the very time they ought to engage more particularly the student's attention, it inflicts the serious loss of much of his early training, the seed having been sown, though the harvest is never to be reaped. If "classics" were delayed entirely to the more advanced school-stage, the pupils would be taught together, in their earlier years, all those subjects which are of common importance to all, whatever be their destination in life: the structure and literature of their own language, its sources and history, with continual *practice* in English composition; two or three modern languages, with abundant exercise in *writing, speaking* and *hearing*, as well as *reading*; the various branches of mathematics; the elements of physical science—in short, all the subjects which are now taught in any—or which ought to be taught in every respectable school. Every pupil would thus, even in the earlier portion of the school-course, receive a valuable mental training, and make substantial acquisitions, which he could turn to account alike in the further prosecution of his studies in any direction, or in the business of the world, should necessity unfortunately require his premature removal from school. In their knowledge of modern tongues, especially, all would have acquired an instrument of ever fresh attainment, from literature current as well as past, and from associations with living men. The interesting and truly valuable, but less useful and important study of the ancient languages and literatures, would be reserved for those who should have the blessed privilege of a prolongation of their school-course. The great complaint now raised against the "classics" is, that they are taught too early and to indiscriminately. By the same simple means both objections are removed. The postponement of "classical" studies would virtually settle the question—who ought to learn "classics?" The answer is: those who can remain at school during the later years of the course.

If fewer persons were taught the elements of "classics," more would learn their use; if fewer learned the letter, more would imbibe the spirit. In this way, those who should still learn "classics," would have the immense advantage of not having sacrificed for their sake things much more important, while those who should not, might well congratulate themselves on having acquired much valuable knowledge, and excellent mental training to boot, in exchange for a pittance of Latin and Greek, soon forgotten, and, to them, almost useless while remembered. Nor is this plan the less worthy of consideration, because it would powerfully tend to renew the prestige of "classical" learning, at the same time that it would systematize the current opinion of a great class of intelligent citizens, who, with DR. LATHAM, feel "the necessity for a limitation."¹
